I don't even bother with kill files or the likes anymore. I just ignore it.
It's like talking to someone out in the distance with a little static on
their signal. After you get use to the static you don't even notice it.

funny thing is,
someone else said that about another "G-man" (hoover) and when it came down to it, that other someone did nothing except get the cuffs slapped on him by hoover personally.

only in your case, if you get gunned down by government agents, they might be doing the rest of us a favor by removing you from the gene pool.

No.

A modulation meter can't move fast enough to measure peaks, so you use
an oscilliscope or a spec-an.

You knew that, though.

I wasn't disputing the claim you made, I was disputing the mathematics and proof behind it.

The electronics don't follow along perfectly, and you don't use a 100 percent modulated radio.

You use a radio with the limiter removed.

Get a stock radio, with no removed limiter, etc. Or simply just do the requested experiment below

Or wait. Bill Eitner, Sean and Dennis will all tell you the PEP kit isn't a true PEP measurement kit.

You want true PEP, that reads correctly, get the Yeasu YS-60. It is a PEP reading meter, that
has AVG thrown in through a correction circuit.

The only thing that would lead the perspective buyer to believe a radio is
doing
16 watts AVG power output would be his own ignorance or the person selling
it lying to him. Period.

> >
> >And you don't read the amplitude modulated signal as well, either.
>
> You read it just fine, just like radio operators been doing for almost
> a century.

If your needle doesn't move, how do you register modulation with it, since
industry practice states that a "mod meter" is worthless?

I also tend to wonder why Bird tells people that the AVG meter is for FM and
CW
measurement, and the PEP is for AM?

Doesn't make sense, since you say the AVG type meter is the only good way to
see
am.

lol.

A "Bird watt" is a measurement of reference, against the Bird wattmeter. We
have
been over this. It would be no difference than calling it a drake watt, if
I used my
Drake meter to reference.

In engineering text, it is NOT uncommon to give a reference to what you use
to make
the measurement if it is an unknown.

If I say my radio does 1000 watts, what am I referencing it against to
potential buyers.

NOTHING.

Kinda like antenna db gain figures.

No, thats where you are wrong.

Their are PEP reading, Peak reading, AVG reading and RMS reading meters.

Your oversimplification still shows that either you don't know what your
talking about,
just talking to hear yourself, or don't want to take the time to explain to
the layman...

Kinda like just saying your radio does 1000 watts, without giving ANY type
of reference
as to what you measured it with.

> You are still confused about PEP and peak-reading meters. PEP is a
> measurement of power at max modulation. A transmitter or amp has only
> one PEP value. If a 4W transmitter is capable of 100% modulation, the
> PEP will be 16W, no less, no more.

So, if you employ negative peak clipping to keep the RF waveform
on, rather than clipped off on neg peaks, then you can run over 100
percent modulation, right? Without clipping off the RF?

Or are you stating that the broadcast engineers are running all these
commercial am stations wrong now?

They employ overmodulation... On positive peaks only.

OTOH, a peak-reading meter will
> measure power at the modulation peaks (yes, that may be nitpicking,
> but if you want to avoid arguments you need to get your terminology
> correct. Like PM FM, and pills, and "bird watts"...)

No, I am talking with people that understand what htey are saying, and to
most people
but you, they understand fine. You seem to be the person having a hard time
understanding.

Take a poll.

See who is backpeddling more, "oversimplifying", restating his comments and
having a hard time
getting his point across. It ain't me.

>
> Regardless, with AM, peak means nothing except that you are
> modulating, and a modulation meter is better to use because it
> seperates the modulation from the RF. It also reads it differently and
> more accurately. If you want "swang", watch the modulation meter.

No, PEP is the way it is measured with the FCC for max output.

So I guess they are wrong as well?

>
> >And the argument was never brought up as to nomenclature of meters and

No?

"Want a FAST reading, accurate, PEP wattmeter to follow voice or digital
characteristics?
Get the 43-400 peak reading kit for your BIRD 43!
"

Taken from radiodan's website. He probably doesn't know what he is talking
about.

http://www.arrl.org/tis/info/shakproj.html

ARRL doesn't, either.

http://www.autekresearch.com/wm1.htm

I think autek must be on drugs, cuz they use PEP, and like all others, tell
you to use a PEP reading meter for AM measurement.

http://www.bird-electronics.com/Documents/pdf/generalCatalog.pdf

Bird refers to their PEP reading 4314, not a PEAK reading, but PEP reading.

I think I have cited enough references... 4 to your none.

No, I asked you what you have set up, in the high power CB arena. You
answered
with not answering, ignoring the question, whatever... Bottom line is you
haven't done
it.

Do you thing that every amateur operator could walk into a commercial
station, dead in the
water, and get the station up and running?

Doubtful, but they have the credentials to do so, since they are "SUPPOSED"
to be radio
operators.

>
> >(BTW twistie, electronics engineering is a

That's why we overvolt. It increases output

Tubes, on the other hand, usually need to be driven
> near max plate voltage for proper operation. But again, overdriving a
> tube on the input can distort your signal because of excessive or

> have the patience or self-discipline to learn things the right way.

lol.

I operate my amateur station the way you want me to. I operate my CB
differently.

THAT is a MAJOR bone of contention with you it seems. You can't operate a
radio
in one service one way, and operate another in a different service.

In
> case you hadn't noticed, textbooks are written for a reason: that
> reason being that the information included in them is generally
> accepted as factual, and can be proven time and time again. A lot of
> people I know have argued the point -you- are arguing, until they
> actually sat down and studied the subject in the proper venue -- not
> in the CB keyclown arena. Myself included.

And I have done the same.

Bottom line is this.

Bird watts is a reference to wattage power output, as measured with a Bird
wattmeter.

Pill is a commonly accepted term for RF power transistor in the CB world
(this is rec.radio.CB, right)

So, all your problems seem to be nitpicking, double standards, or just not
having done something
and claiming it is impossible, doesn't happen, or won't happen, although
most of the high power
operators in here agree with what I have found.

Wonder why that is?

>

And it would be more drivel brought into the newsgroup that has nothing to
do with
the topic

Notice topic: What is a bird watt... A measurement made with a Bird
wattmeter.

>
> >But it's obvious that you want a flame war to prove

>
> Quite right that I started it. However, I am still at a loss as to the
> generally accepted standard for a "bird watt".

Unit of measurement = Watt

Brand of product making measurement = Bird

Bird watt would be a watt, as measured on a Bird wattmeter.

What is so hard to see about giving a reference to your measuring equipment?

>
> >Get off your "I am an EE, and that means I'm right" attitude, and people

>
> Get off your "I am a big-time amp builder and I know everything about
> RF power amps

I never said that. Your inferring it.

and I couldn't care less what the book says or how it's
> really done

How it's really done? Are you saying that I CAN'T get what I claim out of boxes?

Or that I don't understand how an amplifier works?

Stop with the generalizations, and start showing something to back up YOUR claims.

I'm gonna do it my way and I don't care what comes out the
> antenna

Did I state that? No. I also stated that I do spec-an and scope my amplifiers.

More lies coming from Sparky. Anyone notice that he starts making different generalizations when he is on the losing end of a conversation or debate?

I'm just in it for the raw power and that's why I'm so much
> better than any EE because I can tweak more bird watts out of a pill

Never said that

> in PM FM mode

Never said that I use the mode. Phase modulation is a way to get FM out of a transmitter..

Thats all.

I never said it would get you more watts from an amplifier.. That's your doing.

and those professionals don't know what they are doing
> if they can't do what I do so they can't teach me anything

Never said that, either.

and blah,
> blah, blah" attitude. If you want to be an RF tech, fine. Get up off
> your lazy mental ass and do it right.

Ilol.

I suggest you stop with the lies now Sparky. Your looking more and more like someone on
a sinking ship as the days go by. You claim you don't know what a Bird Watt is, but yet
I have been telling you it is a measurement of wattage output as made with a Bird meter. You
don't get that?

The rest of your entire paragraph was you paraphrasing things, and untruths, just to make yourself
look better. I never made the statements above, and I suggest you stick with facts, and truth.

Makes you a LOT more credible in the future.

> modulated or less signal whilest using a bird meter on AM.

Yes. When modulating a carrier, you will have 25 percent of the power in
positive
peaks, and 25 percent in negative.

When you add +25 and -25, what do you get?

0

So the net increase in RMS power is 0, so the power level stays the same.

>
> example 50 watt deadkey un modulated of course, when audio is introduced
> bird swings from 50 to 100 watts RMS.

No, it wouldn't, unless your using one of your peaked up, non-linear radios
and amplifiers
to do these tests with.

am i missing something or is this like
> new stuff?

No, your missing basic textbook am theory.

A properly working RMS meter (which the Bird isn't) will not respond to a symettrically modulated signal when it is at or below 100 percent, and is being modulated by a symettrical signal. (not sure if symettrical is spelled right, little early in the am)

Go read Googles archive of Bill E and Dennis O when they where discussing it. It went on for a few days, and I don't
feel like retyping it all here.

Not all that much really but if you look at yours and think $75 or so you
will get my point. Most of the new ones are built for UHF and up with
pricetags to match so if one built some that were good thru 50 MHz or so,
there would be a lot of call for cheaper ones. Things like steerable
co-phased arrays might not be so bloody expensive.

It doesn't move as fast as a scope, granted, but then neither does a peak-reading wattmeter since the limitation for both is in the meter movement. The modulation meter is just fine for what it was intended to do. And yes, you can get a peak-reading modulation meter. The best ones have peak memory so you can keep track of your signal over the long-term.

Hello The Moskals:

This subject is a crap shoot at best. A lot of good advice here except for Gary Danaher advice on getting a variance, first thing, suggest you look the mater over do some suggested reading, and talk over this with local hams and CB'ers, and even a General Contractor. Before doing anything.

I hired a Attorney that was a Ham, (real pricey but worth it) showed him all the deed restrictions, and associated paper work, and drove him around to all the large tower and antenna installations, in the local area with in a few miles of my location. And we looked over the building codes.

It came down to..... I need a permit for anything over 45 feet. But only if the building and safety guys get involved. But my tower installations are installed per the building code, and then some, who wants the thing to come down? Just like the other 8 Ham and CB'ers in the local area.

I know I have been there, waging war with the neighbors in the mud, blood, and beer. Big Ten-4. I won overtime!

The Lion's majority of towers and antennas do not have a permit or variance, take it to the bank.

The local Building and Safety can make things hard on you, if you take the wrong path here. The tower and and antenna installation will normally get attention from the neighbors, who call the local Building and Safety people and bitch or complain. The vast majority of Building and Safety want to allow the antenna installation, but only if its safely installed. DO NOT install the tower and antenna near power lines, its just not worth the risk, to people and home safety. Another great one, is the ham or CB'er with a No guy wire 70 foot tower, oh brother, don't park your car under neth this one!!!!!

Every city or town will be different, getting back to the crap shoot department again. Being a real human being and not yelling, cussing, and threating the local building and safety guys, like my neighbors did, saved me many times. Always let the other guy be the bad guy.

Look at the ARRL's web site on antenna zoning and such. Bounce around the web site ant look over the material on antenna zoning.

http://www.arrl.org/

Enter Antenna Zoning into the search window, and look around at the treasure of information.

The ARRL sells a book called Antenna Zoning for the radio Amateur, its pricey but such is life! I bought it.

I would keep the antenna up. And do some investigation in the matter, and not take any one persons total advice. Your investigation will yield information that will advise you on the antenna installation.

I have had the local building and safety out to my place a few times, even thou you could count the 5 each 10 foot sections of tower lengths, they said I was good to go, end of story. Probably because the neighbor was being an asshole.

Pleas let us know how things work out.

And make sure there is a fuse between the supply and the radio on both the
red and white leads. A 1A fuse should be fine in the white wire, and the red
should be 2 to 5 Amp for most CB radios.

The Football Game...

St. Peter and Satan were having an argument one day about Football. This goes on and on with both arguing who would field the best team.

Satan proposed a game to be played on neutral grounds between a select team from the heavenly host and his own hand-picked boys.

"Very well," said the gatekeeper of Heaven. "But you realize, I hope, that we've got all the good players and the best coaches."

"I know, and that's all right," Satan answered unperturbed,
"but we've got all the officials!"

--

3 Nuns at the game...

There were three guys sitting behind three nuns in a football game. The men decided to antagonize the nuns, to get them to move.

So the First one says to the others (loud enough for the women ahead to hear), "I think I want to move to California, there are only 100 Catholics living there".

The second guy speaks up and says, "I want to move to Washington, there are only 50 Catholics living there."

The third guy speaks up and says, "I want to move to Idaho, there are only 5 Catholics living there."

One of the nuns turns around and looks the third guy in the eye and calmly says...
"Why don't you go to hell, there aren't any Catholics there!"

Brainbuster.

I was thinking about how people seem to read the Bible a whole lot more as they get older, then it dawned on me .. they're cramming for their final exam.

Hello Sparky: Good question, I don't know for sure, I haven't measured any of that stuff. I would think/guess-ta-mate some change would be there, but not much.

Hy-Gain came out with a phased antenna control to change the phasing on their Penetrator 500, (and earler base antennas) 5/8 wavelength antennas, in a phased array type installation. The antennas where less than 1/4 wavelength apart. They had the antenna phasing control in a box that had different lengths of RG59 coax I belive. It was a sales flop, but I would love to see the diagrams and such on it.

The stunt here, Jay, is that undriven elements are shorted at the box so that with their coax they act as reflectors, they are not co-phased so much as parasitic. What is also done on the classic 1/4 or 1/2 wave installations is to switch in extra feedline to vary the aim. While I have not heard of it being done with less than 1/4 spacing, the theory does hold up for doing so subject to the antenna creeping toward omnidirection. You mention the RG59 Qsection which kind of sounds like they were in fact co-phased. It is BTW where a cheaper DowKey style relay would be useful as hell.

Where you damn well need some good relays is the classic EME installation with a transceiver, a transverter, and an amp. Unless you really enjoy the smell of front-ends frying, sequencing the T/R so that you do not get a belch of rf from the amp into your preamps is really necessary. Some of the single-relay amp designs are asking for smoke out of the transceiver on capacitive coupling alone. Besides, the old Dowkeys made such a satisfying clunk.

The jolly boys at Hy-Gain were out of Lincoln NE and made all sorts of wonderment including the Galaxy line they picked up when World Radio Labs bellied up. You could learn a lot studying the ancient and honorable Hy-Tower.

From: wavelengthzero@aol.com
Message-ID: <8b6cfc98.0201121248.c5f2418@posting.google.com>
Source record: 111870

In a few months the FCC is going to stop accepting AM 40ch radios, SSB radios will only be type accepted for the CB band. I think its great this is going to happen. no more AM modulation

1631. Re: What's a "Bird Watt"?

Give up, Toll. Why not just admit that a "bird watt" is CB-talk for an arbitrary measurement made by "that real expensive meter a tech used when he peaked my radio out"?

>as to what you measured it with.

The "average" of a sine wave is so close to RMS (AVG = 0.9 * RMS) it's
not significant, so the two terms are used interchangeably where the
difference can be ignored. But you can't measure audio (SSB) with RMS
because it's not a sine wave, so you have to use peak values, or PEP.

As far as "PEP" and "peak", I'll give you that one because I think I
might be nitpicking a bit too far there. Just like those people that
say, "two hundred and forty two", which isn't 242, but 200 and 42. Or
those people that like to measure weight in grams. It may not be
proper, but it's not that important.

>> You are still confused about PEP and peak-reading meters. PEP is a

>"
>
>Taken from radiodan's website. He probably doesn't know what he is talking
>about.

He probably does. Did you ask him what is better for measuring AM
power? It doesn't say one way or another on his site. (BTW, did you
notice he uses the term 'peak reading'? Doesn't matter tho, I conceded
the issue.)

>http://www.arrl.org/tis/info/shakproj.html
>
>ARRL doesn't, either.

Sorry, I'm not a member, so I can't access the articles. Maybe you
could just quote a line or two where it says measuring AM should be
done with a PEP meter.

>http://www.autekresearch.com/wm1.htm
>
>I think autek must be on drugs, cuz they use PEP, and like all others, tell
>you to use a PEP reading meter for AM measurement.

No they don't. The page says that many leave their meters in peak
(PEP) mode. Nowhere does it suggest PEP be used for AM. On the
contrary, it suggests that the 5 watt range be used for CB, which
would go well above that value in PEP mode.

>http://www.bird-electronics.com/Documents/pdf/generalCatalog.pdf
>
>Bird refers to their PEP reading 4314, not a PEAK reading, but PEP reading.

So where on the Bird site does it say that you should use a PEP meter instead of an average meter for measuring AM? Is that page on a hidden link or something?

>I think I have cited enough references... 4 to your none.

Your references just show that peak-reading wattmeters are frequently called 'PEP' meters, and you failed to prove that -my- meter says anything other than 'peak'.

Now pay attention, Toll: Power is measured by using RMS voltage and current values, not peak. Your peak readings are not an indication of power. Even a 12 watt PEP SSB signal will dissipate only 3 watts in a 50 ohm resistor.

Measuring AM with a peak reading meter is only a deception, Toll.

>water, and get the station up and running?
>
>Doubtful, but they have the credentials to do so, since they are "SUPPOSED"
>to be radio
>operators.

Not doubtful at all. They can recognize what goes where and how it works. It all runs on the same basic concepts, but a broadcast station just uses a bit larger equipment. Any ham that has the fundamental understanding of how a transmitter works could probably find his way around a broadcast transmitter.

>
>
>That's why we overvolt. It increases output

A lot of that power is in harmonics. One of the tricks I use to get a
super-clean AM signal out of those power tetrodes is to run AB1; i.e,
underdriven. The tubes are bigger but the signal is cleaner, the drive
amp is simpler and the entire system is more reliable. Overall, it
performs better for less maintenance and less expense. You can't do
that on the semiconductors, but at least you can keep it in the linear
region by not overdriving it. And if you are trying to swamp someone
else's signal, wouldn't it be better to get all your power on one
frequency instead of spread out all over the spectrum? Overvolting
isn't too smart, Toll.

>Tubes, on the other hand, usually need to be driven
>> near max plate voltage for proper operation. But again, overdriving a

>What is so hard to see about giving a reference to your measuring equipment?

Well you were making claims that it was the ultimate standard by which
to measure a CB radio, when in fact just about any wattmeter will show
the same thing. Yeah, not just 'watts' but 'Bird watts'! Oooh, that's
impressive for sure! A watt is a watt is a watt, Toll. Try looking up
'Bird watt' in the old Van Nostrands, or maybe CRC's HCP. Or even
Oxford's latest dictionary. I don't think you will find it because it
ISN'T a technical STANDARD, as you are so willing to convince.

>> >Get off your "I am an EE, and that means I'm right" attitude, and people

The problem is that you don't claim much, except that they will suck
up lots of gasoline and airspace. Which I'm sure they do.

>Or that I don't understand how an amplifier works?
>
>Stop with the generalizations, and start showing something to back up YOUR
>claims.

I'm sure you understand some of the basics, just enough to get you or
someone else in trouble. Nothing more.

>I'm gonna do it my way and I don't care what comes out the
>> antenna
>
>
>Did I state that? No. I also stated that I do spec-an and scope my
>amplifiers.

But you have never made any claims as to how clean they are. Do you
have any numbers? Any third-party verification? Save it, Toll, we all
know you are not interested in communicating with those things, just
the "raw power" out the antenna.

>More lies coming from Sparky. Anyone notice that he starts making different
>generalizations when he is on the losing end of a conversation or debate?

Ever notice how people stop making and start complaining about
'generalizations' only when they can no longer address the specifics?
Ever notice how you change the subject when you lose your point? Or
how you totally ignore it?

>I'm just in it for the raw power and that's why I'm so much
>> better than any EE because I can tweak more bird watts out of a pill
>
>Never said that

Close enough. That was your attitude, and that's what I'm describing.

>> in PM FM mode
>
>Never said that I use the mode. Phase modulation is a way to get FM out of
>a transmitter..
>
>Thats all.

Phase and frequency modulation are similar, but seperate. Try reading
up on the differences. Oh, that's right, you did -- PM will dip a
fixed-amplitude carrier when FM won't!

>I never said it would get you more watts from an amplifier.. That's your
>doing.

I was lumping your terminology into one phrase, in case you couldn't
tell.

>and those professionals don't know what they are doing
>> if they can't do what I do so they can't teach me anything
>
>
>Never said that, either.

Again, that's your attitude. YOU were going to teach ME some things
about amps and RF, remember? YOU were the one that claimed I never
went to a keydown so I didn't know what I was talking about. YOU were
the one that thought I didn't even know anything about power RF. It
all adds up, Toll. Flip through enough pages and you can usually
understand the plotline.

>and blah,
>> blah, blah" attitude. If you want to be an RF tech, fine. Get up off
>> your lazy mental ass and do it right.
>
>
>Ilol.
>
>I suggest you stop with the lies now Sparky. Your looking more and more

>a sinking ship as the days go by. You claim you don't know what a Bird Watt
>is, but yet
>I have been telling you it is a measurement of wattage output as made with a
>Bird meter. You
>don't get that?

No, you said it was some super-standard for CB amps, like a 'Bird
watt' is a better thing than any other watt. It's -your- ship that's
sinking, Toll, and it's sinking fast. Not only do you NOT know half of
what you are talking about, but you want to continue your charade in
order to get yourself killfiled by most of the people on the group. I
don't care, I'm already in lots of killfiles, and anybody that hasn't
plonked me and reads my technical posts knows that you should be
looking for a life preserver right about now.

>The rest of your entire paragraph was you paraphrasing things, and untruths,
>just to make yourself
>look better. I never made the statements above, and I suggest you stick with
>facts, and truth.

Paraphrasing, yes. Untruths, hardly. All my conclusions are based on
what you have said.

>Makes you a LOT more credible in the future.

My credibility is not your concern, but maybe it should be. I don't care what people think about my attitude, just as long as I get the facts straight. When I'm wrong I admit it, like with the PEP meters, and the co-phased antennas. You have pushed this whole thing so far that you don't even remember what the issue was. So let me refresh:

You poked your nose into a conversation comparing 50 volt transistors to 12 volt 'pills', claiming the 12 volt devices could be overpowered so much better while retaining spectral purity, and implying that PEP 'Bird watts' was prima-facie proof of quality. I called you on both issues, and so far you have proven nothing, except that you really don't know as much about RF as you claim. Care to continue?

Point taken. So if there was an inexpensive one designed for not much
more than HF, that would be a big seller in the amateur community?

This 1/8w thing is news to me. I worked out a lobe angle of about 12
degrees (don't ask me to show the math, I think I goofed), so how
would something like that compare with a typical beam in practical
use? Every try it?

1637. If you want a great cb base, check out the ICOM IC-78 commercial radio (Review)

Newsgroup: rec.radio.cb
Date: 2002-01-12 21:13:08 UTC
From: wavelengthzero@aol.com
Message-ID: <8b6cfc98.0201121313.1e122162@posting.google.com>
Source record: 111874

The IC-78 is the ultimate CB base for about 560, no mods required at all and it transmits from 1.6-30.

You can program all 40 CB channels into it and just turn the knob to change channels just like a CB except its a real quality radio. Anyhow I have mines set with Alpha numeric labels for all cb channels "CB 1, CB 2, CB 3" would display when I change (in big letters also) built in automatic SWR meter and Finals protection (cant burn the radio from a bad antenna) and if you connect it in reverse powerwise it also protects itself from damage. Pretty fool proof design. The AM transmit with the BASE SM-20 mike is excellent and rivals other radios like ranger etc.. the Handheld mike is okay for AM though. Anyhow its not a monster lookig radio like the Ranger 2990's etc and looks much better crafted and has better recieve circuits. SSB on the unit will not drift period and using SSB on the ICOM is as easy as using AM no messing with the rit every second etc. for example when I tune to 27.555, its right smack center no RIT needed, voice on SSB sounds clear and no donald duck. anyhow check it out

Hello Skipp,

Explain to me again why a website regarding vintage 10-meter ham radio
transceivers must be promoted continually in a CB newsgroup?

I know you had some lame excuses like "the 1011 has a receive-only
option on CB" or "many hams read the CB newsgroup" but I've forgotten
most of them.

A bit of advice, if you are trying to reach "hams" you might try --

rec.radio.amateur.misc,
rec.radio.amateur.boatanchors
rec.radio.amateur.equipment

-- or any of the dozens of other ham-specific newsgroups rather than
confine your postings to generic radio swap and cb groups.

Is English a second language to you, Wolfie?? They reallocated 27MHz OF
SPECTRUM SPACE, not the 27 MHz range. Reallocations included:

216-220 MHz 4
1390-1395 5
1427-1435 8
1670-1675 5
2385-2390 5

Total 27 MHz

Basic housekeeping after Congress several years ago ordered the keepers of
Federal freqs to get off of some of them and let the people make a buck.
No Big Deal

Read it carfully. It says they're reallocating 27mhz of spectrum from those other services to some new ones.
They're not relocating the 27mhz (11m) band.

Another try.. Obviously legit posts go unanswered in here... Flames are more important...

I'm looking to find the audio amplifier in this radio. There is no audio in or out of the unit, so I am assuming the amplifier is the problem.. My problem, however, is that the typical audio amplifier package is not used in this radio. I have no schematics or anything like that to go by, so I am having a hell of a time trying to find it

Here is a list of the transistors I can see in the unit that are heatsink mounted...

C1760 - Believe to be the driver? Close to what I believe is the final...
C1239 - Final?
C1096 - Two of these mounted to the same heatsink right next to each other...

I'm guessing the Two C1096's some how comprise the audio amp(s), though I'm not sure..

Anyone have any ideas? Perhaps a suggestion as to what could be wrong?

History: Owner was listening to the unit, and a nearby radio keyed up (possibly powered); then nothing... Nothing in, nothing out..

Thanks!
PH

Purchased Cobra138 from this individual, was supposedly shipped on the 4th or 5th, then was told that he"got it back" due to a post office error. Has been unable to provide tracking number, and emails rather vague. Wondering if anyone else purchased this, or any of the other gear he had listed. He was to have reshipped the radio today and provide tracking number by 5PM but no word.

MO went to John Curtis, Elkhorn Drive, Frankfort KY. Did a search on him and the only posts I can find are his original ads for the gear. Figured I would check on the NG before I went any further with this to see if my worries are warranted.

Many thanks.

Cobra has its SoundTracker, and Midland has its DSPIII. Which is best at
"noise elimination" Are they fancy names for something that doesn't work,
or do they do as claimed. Which is best?

Talk to some Eastern Eurpoean immigrants within the last 2 years and you will LEARN how commy we have become, practicing ALL 10 planks (most people do)!

government is not communist.

It may be worse than that. It is WICKED AS HELL when the CIA brings
the drugs into the nation to fund itself, while they STOLE a Church building
from the Baptists in Indianapolis last Feb. !
>
> You keep ranting about ANY government

NO, I didn't say ANY. Just the ones that are put there pursuant to the
10 planks!

regulation being communist (at least
> that's how you
> come across), yet we have more access to radio spectrum than many other
> countries. Are you

That's because GOD blessed a FREE Christian Republic like we USE to
be, and radio and everything else took off here, because we didn't have the
NONSENCE and UNBiblical controls of Europe!

> aware that, in Britain, one has to have a license to own a television--a
> LICENSE to watch TV
> in your own home. Now Britain certainly isn't communist--more socialist

It definately is worse than US, but maybe we should licence the
TRASH on TV and don't give out the licences!!!!

> than we are--but if
> we really were in a communist country, your CB shop, your products, and
your
> ability to use a
> radio would shortly be curtailed, seized, fined, whatever. Totalitarian
> governments operate under a fear of their people because they know as well

No, the people are under FEAR in those countries. If it becomes
unbearable enough, the people WILL rebel, pursuant to Romans 13.

> as anybody that, given a chance, the people would rise up against the
> iron-fisted tyrants. Yet, you here in the best country on earth can go
down
> to the local Wally World, purchase a CB or a

I try to avoid "TOWN KILLER" commy WALLY ! They ARE the commy
instrument to destroy SMALL BUSINESS to make more CENTRALIZED (get it?)
stores! Remember, in the commy country, they have 1 store. It is called
IGOR Wally's place! It IS the state's store! Incorporated (created by the
state) it is the opposite of what GOD wants us to have (every one under
their own fig tree).

scanner, go home and talk or
> listen

Yeah right! The commies don't like my 869-890 receivin' cell
scanners I have left to sell!

> away. Yet you still have this "fear" of the government that WE the PEOPLE
> elected! You insult the intelligence of the

You NEED TO talk to those East European immigrants again. THEY
WILL tell you HOW STUPID the Americans are (I hear this all the time from
them) and THEY SAY that YOU don't even know what they are doing to you! The
American people NEED TO REPENT FROM SIN, BIG TIME.

American people, Congress, and
> our President by slinging labels
> based, mostly, on a single issue: the fact that you can't just grab a
radio,
> fire up with a gadzillion
> watts on 7.255 and jabber away, or you can't chat with the local police

> while allowing as many people as possible to enjoy a slice of the radio
pie.
> And you call THAT communistic? I don't
> THINK so.

The 6th plank says what the 6 plank says. I agree with you in part,
but PRIVATE always works better than Govt., right? !

>
> So why, Dave, can't you "render unto Ceasar that which is Ceasar's, and to
> God that which is

Ceasar IS DEAD. The problem is that so called "Christians" have rendered it
ALL to their real god, the Orwellian state!

> God's?" No government is perfect because it is made up of imperfect
people,
> but we DO try.
> "Ceasar" (in our case, a representative republic) is necessary to protect
> the people from enemies, both foreign and domestic, reward the good, and
> punish evil. That's why we have laws. I, too,

That is the Romans 13 PURPOSE of govt., FOR OUR GOOD. When they
cease to do that, they are not legitamate Biblical or Constitutional
government!!!!!!!!

think some of them are silly
> and overly restrictive--like, for example, seatbelt laws.

Those are put there BY the INSURANCE INDUSTRY to save them $$$$ in
their pockets!

> I wear my seatbelt regularly, fastening up without thinking. But I DO NOT
> like the idea of it being a law that I HAVE to do it. But over all, I

I don't do it @ all because it is a 50% / 50% thing--it may save you
and it may KILL you. The insurance industry figures they can save $$$$$ IF
people wear them. I am too old fashioned to do it!

> believe in our government and its policies.

I KNOW that our federal govt. has VIOLATED the Constitution that is
suppose to BIND IT DOWN by doing and promoting every UNGodly and

unConstituional and UnBiblical act it commits in promoting ALL the wickedness it does, will surely and HAS ALREADY incurred THE WRATH of GOD on it, because of it's many sins. 2 Chron. 7:14 IS still the answers. It is THE preachers fault for things that have gotten as bad as they are.

> AND I believe in the rules and regulations that govern radio. Without them,

I talked to an OLD guy recently and he said that PATSY KLINE was the 1st to use echo in the early 60's, in music. I seem to remember hearing in in 50's rock, wasn't it, you GREASERS out there? ! He said that echo was put in AFTER she did it into those 50's songs.
Dave!!!!!!!!!!!!!!!!!!

Yeah too bad for you. The FCC is reallocating CB to 9454500 mhz. It
says so, you read it, right? Now you'll just have to throw away all
the illegal equipment :)

Greetings!

Sounds like what Robyn radios used to do. They used a similar
push-pull config [perhaps paralleled instead]. They are located in the
back of the radio by the AM Xfrmr. I'd check to see if any of the caps
in this section shorted out.

Does the AM modulation transformer have current going thru it?

Instead of using a typical multimeter, use a test light with a low
current 12V powered lamp. Sometimes the Transformer would show a
leakage due to one of the windings shorting to another and allow a low
current with the voltage of the battery feed to leak to the others if
you checked with a DVM. Other heavier loads wouldn't make it thru the
failed winding.

If the lamp lights, it should be ok, if not, but shows voltage on the
DVM, the Xfrmr is shot. You need some current draw thru these windings
to make sure it's not a short. Even then you can't rule it out.

Did you check the output cap? These things are so old, they use
non-standard values of what we have available today.

I'm thinking that one of the caps is shot, and may have taken out one
of the pair that drives the transformer.

You may be able to salvage it, ECG and NTE still offer discretes to
replace them, but no guarantees that these parts are bad. You may need
to pull them and check with a DVM.

These things [Robyn] also use an old RX/TX relay, did it bind up? Can
you get a carrier output? I'm not sure of the Midland if they did away
with the relay and went to electronic switching.

I don't have much to work with so I'm doing the best I can to offer
some help.

Source record: 111989

Thanks for the input...

I haven't checked it over all that thoroughly yet, so I can't offer up much at the moment...

There is carrier coming out of the radio, just as there should be..

There is no relay in the unit. It's not that old of a unit. It was manufactured in !977, and has the full 40-channels.

The reason I am trying to salvage it is because it is an extremely unique unit. It can be mobile mounted in a car, or can be used as a portable radio. It uses a speaker/mike, and slips inside a large, leather, full-body case that holds batteries, and has an antenna adapter that hooks to the antenna socket. I'm guessing it's a loading coil... Into this unit screws a large telescopic antenna.

Very cool radio, and I would like to get it up and running again... If you might be interested in checking it out, I can get up some pictures of the unit.. It's really a sweet old radio.

Thanks again for the advice!
PH

Wrong again, Toll. A 4 watt carrier with 100% modulation has 1 watt in
each sideband, but those 2 watts don't come out of the carrier. Total
signal power is actually 6 watts.

>> example 50 watt deadkey un modulated of course, when audio is introduced

Since you are so well-versed in AM theory, maybe you can explain why
those 2 watts on the sidebands don't show up on an RMS meter.

1703. Here's why PEP meters are not used for AM

Newsgroup: rec.radio.cb
Date: 2002-01-13 11:09:50 UTC
From: sparky@cet.com
Message-ID: <3c416af0.20708153@news.cet.com>
Source record: 111988

First, just to clarify:

The total transmitter power is the sum of the fixed carrier power and the variable sideband powers. If you want to measure total power, first measure the power of the carrier with an RMS meter (or an 'averaging' meter and multiply by 1.11). Then calculate your sideband power using:

P(usb) = P(lsb) = (M^2 * Pc)/4

Where:

M is the modulation index (percent/100); and
Pc is the carrier power.

So a 100% modulated 4 watt AM signal has a total power of 6 watts: 4 watts from the carrier, and 1 watt in each sideband.

Now,

A 4 watt carrier doesn't change in amplitude, so a PEP measurement of that carrier by itself is still just 4 watts. If we measure a 1 watt single-sideband signal we will see a PEP of 4 watts (PEP = RMS * 4). If we measure the carrier and two sidebands at the same time we will see that the PEP meter mixes all three for a higher peak power: If the carrier is 1 volt p-p and modulation is 100%, the carrier voltage is doubled and the power is quadrupled. So a 100% modulated AM carrier of 4 watts will show a PEP of 16 watts.

But a receiver does not see an AM signal at 16 watts PEP. The AM components do not mix together in the receiver for a higher peak power as suggested by the PEP meter. This is because the radio receiver is frequency-selective and the wattmeter is not. In the receiver, the carrier and the sidebands actually 'stand alone' from each other, and the radio sees three 4 watt peaks instead of one 16 watt peak!

PEP is not -real- power, but only an instantaneous "talk-power" value for SSB. While a PEP meter is a very good way to measure SSB signals, it is a very poor choice for measuring AM power.

Do not use foam coax for power. The center conductor can push through
the dielectric too easily. I would not use coax for power. I use
stranded THHN wire for underhood applications.

You have to be kidding. Multiply the average power times 1.11 to get
the RMS power?

Average when used in the v/c conversion tables are just
the mathematical average of the voltage or current measurement.
This is not very useful. When used to describe power it is different,
It is the overall effective ,or heating power in the circuit. In other
words , it IS the RMS power.

snip

>PEP is not -real- power, but only an instantaneous "talk-power" value

PEP is not an instantaneous power. If it was then a typical 4 watt
100% modulated AM signal would be 32 instantaneous watts.

PEP is a real power. Specifically it is:

"Peak Envelope Power of a Radio Transmitter......The average
power supplied to the antenna transmission line by a transmitter
during one radio-frequency cycle at the highest crest of the
modulation envelope , taken under conditions of normal
operation."

Hi.

From what I read, that only reads new while on-line.
I have the software, but I have never used it as I like to download messages and then read them while off-line.
Even if I got an "unmetered" connection, they are usually limited to 2 hours before you get booted off, and have to try for a vacant modem again. Those who compose their messages and e-mails while on-line often end up booted of before the get to do any "surfing".

Some "unmetered" ISPs are harder to get back on than others. But "PaYG" services are almost always first time connect, unless they have a system fault. But then the ISP gets a percentage of the "PaYG" local call charge, so they have to connect you to make money.

Brainbuster.

Hi Steve.

I use a killfile, as it reduces the time taken downloading the messages. I
don't like keeping the computer and phone line busy downloading rubbish
that I will not read anyway.
No, I don't have a separate line for the internet as I don't spend enough
time on-line to need one.

As I said, I was explaining Daves position, and that his belief is shared by others. The problem is that some people take these little differences of opinion as major points, and end up starting their own religion (or killing each other).

They can argue all they like about the exact meaning of each word or verse, but the Bible makes it clear that there is only one requirement for entry to heaven... Belief. (John 3v16 and Luke 23v42 + v43). Although some religions believe that you get to heaven through "good works", and will probably give different meanings for those verses.

===
> The King James, to the extent it was not lifted bodily from the Geneva
> Bible, largely is based on Erasmus Greek Bible which in turn translates
> back into Greek a lot of Jerome's Vulgate. There are existent today a
> number of manuscripts that take us well back into the early centuries,
> none of which were available to James group of scholars. For all that
> they did not do a bad job; it suffers today more from being in the English
> of Shakespeare than it does from mistranslation. Some of the
> mistranslations are repeated in the Book of Mormon.
===

Mr. Smith did quite well at translating the alleged originals... for an illiterate. Strange how nobody else was allowed to see them, and they were "taken up to heaven", so the only proof that they ever existed is his word.

===
> Read Romans and you get the feeling that Paul not only believed that the
> Creator and Jesus were separate, they each had their own spirit. The Word
> thing has echoes of the Gnostic which is probably why John was written in
> the first place. Johnine writings are second only to the Trinity for good
> arguments.
===

Even the authorship of that Gospel is a bone of contention.
The last two verses are taken as proof of authorship, but take them in the context of the whole chapter, and particularly v21 - v23, and who could it suggest that the last two verses refer to?
One thing that is clear... The author was someone who witnessed those things, and actually met Jesus.

===
> And I spent a good part of the morning dreading the appearance of the

> Christianity, Hell must be eternity reading bad phamplets.
===

Those guys must be on comission... they don't take no for an answer.

It would seem that worldwide, there are more Mormons (Chuch of Jesus Christ of latter day saints) than Jehovah witnesses. But you mention Mormons here, and many people will say "Who???". Figures are given in the "World Book", which can be got free from many computer stores in the UK (on a Supanet ISP disk... you can install it without signing up).

Someone once told me that he carried a wallet around with nothing in it but a few christian pamphlets. Any pick-pockets that took his wallet were taught the error of their ways. That's what you call "targetted advertising", aiming it direct at the sinners... something that a few people we know of should learn to do.

Brainbuster.

1717. Why Bicycles are better than Women...

Newsgroup: rec.radio.cb
Date: 2002-01-13 16:17:59 UTC
From: Brainbuster <brain@buster.com>
Message-ID: <a1sgo7$4ul$9@newsg1.svr.pol.co.uk>
Source record: 112115

Why Bicycles are better than Women...

Bicycles don't get pregnant.

You can ride your Bicycle any time of the month.

Bicycles don't have parents.

Bicycles don't whine unless something is really wrong.

Bicycles don't care how many other Bicycles you've ridden.

Bicycles don't care if you look at other Bicycles.

If your Bicycle goes flat you can fix it.

If your Bicycle is too loose you can tighten it.

If your Bicycle is misaligned, you don't have to discuss politics with it.

You don't have to be jealous of the guy who works on your Bicycle.

If you say bad things to your Bicycle, you don't have to apologize before you ride it again.

You can stop riding your Bicycle as soon as you want and it won't get frustrated.

Your parents won't remain in touch with your old bicycle after you dump it.

Bicycles don't insult you if you're a bad rider.

If your Bicycle doesn't look good you can paint it or get better parts.

You can ride your Bicycle the first time you meet it, without having to take it to dinner, see a movie, or meet its mother.

Brainbuster.

Relationships are hard. It's like a full-time job, and we should treat it like one. If your girlfriend wants to leave you, she should give you two weeks' notice, and before she leaves you, she should have to find you a temp.

You need to get on the FREEBAND, the regular CB channels 1-40 are
useless for any form of communications. on the freeband you can
actually make contacts. I would return it and get a export radio

Nope, You will see. the FCC is will be giving Uniden etc.. a grace
period to sell off all AM models but by 2003 all models will be
required to be you will se the pressrelease in a few months.
1. SSB only
2. have a TXCO with a stability of +- 350Hz or better

so Uniden has 2 choices get out of the CB market before 2003 or only
sell SSB units that meet the 350hz spec

Hello Moparholic: Yes I believe one of the Guys from General Radiotelephone, or one of the Messenger guys tried to fix the drifting problem, in the Swan 350.

After installing expensive new (frequency determine capacitors) parts and such the thing still drifted. Perhaps the design with the tubes mounted on a circuit board had something to do with it?!!?!?!?

Big Bob got out of prison last year and he started with a old Swan 350, on SSB. It just drifted too much. He took Mountain Mans lead and bought a Icom 746, and a Commander 2500 Linear Amplifier, using a neat wire Log Periodic, right out of a old QST article.

And then upgraded with time, he was paid for his wrongful imprisonment. He's really a neat guy, I am sure his settlement is a Gazillion dollars, but still drives a old pick up truck around and threatens to put the old Swan on line again, when the locals get roughty or out of line by playing music and hitting pots and pans, and the radio excerpt from the old radio show "The Long Ranger".

Hello Sparky: Yes I use to know how to do all the vector addition, but old age and my rum soaked brain, has miss placed my notes.

In the 60's & 70's some antenna manufactures sold a kit for phasing the antennas, the hardware did not allow for ant antenna spacing adjustments, and was pretty vague, but was done. Maybe thats were Hy-Gain got the "Phase em" idea.

I have measured interactions with my antennas, it seems that the most good or bad occurs in the first 1/4 wl. Maybe thats why most bean elements are spaced within a 1/4 wl?

I have also phased Station Masters Antennas for the sole purpose to lower the angle, form a lower mounted height. I didn't get to finish the experiment, but left with the idea that if I could get the antenna up like in a normal repeated site installation, the phasing wasn't needed, and was a waste of time and money.

The ARRL Antenna Cond Books show a how a set of HF beams, can be used to steer the elevation angle, pretty neat-O. Now if I could phase a set of verticals and be able to steer the elevation angle, that would be worth writting home about.

Because it isn't.

In medical, when you make a measurement, you also site your reference.

In physics, same thing.

When I worked at an oil and gas exploration firm, we HAD to give ALL references
to measurement equipment.

Bottom line is, Sparky knew what I was referencing when I cited a "Bird Watt",
it was on topic (since most high power operators use the same term), and he just trolled it.

Kinda like you do

I need your honest advice on an amp that I was considering buying. I was thinking about buying a Texas Star 350HDV, but this may turn out to be a better deal. I found a used amp for sale by a respected tech on the internet. He used the guts from an X-force amp. He described it like this:

"400w amp. The guts are of a XForce with (2)2879s, biased class B for ssb and a ssb delay switch. It is fan cooled. This is one of a kind as I designed the case for it. It is shaped like a bar of gold, with a fan on one side and air intake on the other. The front has the on/off with led and a ssb switch with led. It is really clean on ssb and cruises at 400w easily."
I inquired more about it and he told me this:

"It is essentially the same as a Magna Force 350, just in my own designed case. Up to 200w rms or as much as 500w peak. Only requires 2w carrier and 15w peak drive to achieve 400w peak or ssb. It is biased class B. Amp draw around 45a. It is an excellent amp for everyday use AM or SSB, and would be competitive with most 400w amps in power output. As I described it has an unusual shaped case and is one of a kind."

I have the problem of only having an 90 amp alternator. I do thought have a 900 CCA battery. He told me that this:

"Your car will handle the amp fine. The radio has variable power, and I'd set that at about 2-3w. The amp has on/off and ssb delay switch. I ran it like that with zero problems on a Ford Ranger 65 amp alternator and a cheap battery."
So I guess what I'm asking is do you think this would be a good investment? I need your honest opinion should I buy this amp to use with my Northstar 9000, and Wilson 1000 trunk lip mount?

I have a Tristar 240 CB Radio that I purchased about 4-5 years ago....

Any Idea where I can get a manual for it as I lost it... or accessories or company info on Tristar?

Any help greatly appreciated.

-Jason

1736. Good Freeband Radio??? Recommendations?

I am told that England is an especially prized missionary assignment among the LDS because old Brigham Young did it.

Whatever else he was Brigham was a really crummy navigator. We have a cemetary in North Omaha from the trek West. Perhaps to stay out of the way or simply because he forgot about the rivers flowing generally south his trail ran on the north bank of the Platte where the Oregon Trail and the Union Pacific RR ran on the much flatter south bank. The guys pushing the carts must really have appreciated his skill.

The LDS suffered a schism many years ago and the remains have GHQ in Independence MO. Essentially the same split as Shia and Sunni Islam; the survivors of Joseph Smith thought it should be kept in the family.

The one thing that is for lead pipe sure is that we will face God one at a time, not as a member of a sect.

Bird says the 43 Model is for measuring single carrier, CW, FM and phase modulated rf signals. They consider there readings as average power they do not call it rms.

Accuracy: +/- 5% of full scale.

The Apm-16 is for measuring Am, FM says also where pseudu random waveforms and high or arbitrary peak to average ratios can complicate accurate average power measurements with conventional CW type watt meters.

Peak/Avg Ratio: greater than 10 db

1751. Re: Here's why PEP meters are not used for AM

>
>Yes it is. But when working with sinusoidal waveforms, the average is
>0.9 times RMS. Basic AC circuit analysis. Look it up.

Again you should look it up. When speaking of voltage you are correct.
But we are speaking of power. So:

Average power = "RMS power" even though technically the term "RMS
power" does not exist.

>>>PEP is not -real- power, but only an instantaneous "talk-power" value
>>>for SSB. While a PEP meter is a very good way to measure SSB signals,
>>>it is a very poor choice for measuring AM power.

Wrong again, Toll. If you are going to properly reference a
measurement, you need to provide the make AND model of the test
equipment, the conditions of the test, etc. All you said was "Bird
watts". Try again, Toll.

right, and we can call a watt whatever we like to since a watt is a watt is a watt, right? why cant you understand that the term "bird watt" is a very nontechnical phrase used by cb'ers and its just reffering to RMS output of a transmitter. you keep asking for a text book description when you know very well its a slang phrase and there isnt one available. do you think all of this is making you look good? to me it just seems your a crochety old man that nit picks every word and phrase when its really not needed. we've told you 100 times at least in this thread and others what the term bird watts refers too, its a adjective not a noun.

>

Yes it is. But when working with sinusoidal waveforms, the average is
0.9 times RMS. Basic AC circuit analysis. Look it up.

You will have to show the math on that one. And if it isn't a measure
of instantaneous power, why does the value change in direct relation
to the level of modulation?

>PEP is a real power. Specifically it is:
>
>"Peak Envelope Power of a Radio Transmitter......The average
>power supplied to the antenna transmission line by a transmitter
>during one radio-frequency cycle at the highest crest of the

>operation."

If you check your SSB basics, PEP is the measurement of the
peak-to-peak voltage and current. I.e,

PEP = vp-p * Ip-p = 2((1.414^2)*(Vrms * Irms)) = 4Prms

So real (RMS) power is actually PEP/4. With a 12W PEP signal, only 3W are dissipated. THAT'S the REAL power, NOT PEP!

george, there are very very few actual key down participants posting in here. the rest of it is guys like yourself and sparky making unfounded claims about keydowns and those that enjoy them while all the while never actually participating in them. i see sparks has backed off his claim that huge numbers are not possible in mobiles and he's taken after the whole "bird watt" thing since he was totally wrong about the mobiles and feels he might get at toll free with this one. very petty and clearer than ice

Export radios are illegal to sell and use. Believe me, I know. I just
got a few auctions for them stopped on eBay today.

You don't listen. I don't dispute the above paragraph. However you
stated that an average power must be multiplied by 1.11 in order to
get the RMS power. That is wrong. There is NO difference between an
Average power and an RMS power.

>>>If you check your SSB basics, PEP is the measurement of the
>>>peak-to-peak voltage and current. I.e,
>>>

>
>Like I said before, this is a SSB fundamental. Maybe you should have
>taken my suggestion and looked it up yourself. I can provide many
>references for this as well.

PEP does not stand for peak to peak power!

Give me a break. You already said that a 4 watt carrier is also 4
watts PEP. How could this be so if you go by you statement that
PEP = Vp-p * Ip-p ????

Example:

A 4 watt carrier at 50 ohms = 14.14 volts RMS

A 4 watt carrier at 50 ohms = .2828 amps RMS

14.14 volts RMS = 40 vp-p

.2828 amps RMS = .8 amps Ip-p

So let's use your incorrect formula now (PEP = Vp-p * Ip-p)

40 * .8 = 32 watts PEP?
All this from a 4 watt carrier? Give me a break.

****
The truth is that A PEP wattage is an average wattage that is only taken at a specific period of time. That time is during a modulation peak. It is not derived from a voltage peak! Nor derived from a Peak to Peak voltage measurement! You use the RMS voltage and the RMS current during a MODULATION PEAK to get the wattage. That is why a 4 watt carrier is also 4 watts PEP.

They are accurate when driven with a sinewave, not voice modulation, and it
has to be steady state.

I made my statement based on ARRL Handbook about modulation meters and
their worthlessness to the average amatuer or other radio operators.

Most shops only use them to set the output level of their signal generators,
anyway,
not measure final output. I don't see many, if any boonton mod meters that
are rated
for 100 thousand watts of output anyway.

What does your Bird manual say?

http://www.bird-electronics.com/Documents/pdf/Model_5000_and_5010_Users%20Gu
ide.pdf

Says at the graph at the bottom of the page that the only meter usable for
AM Its a PEP reading meter.

Amazingly, the avg / rms meters aren't rated for AM measurement. Hrm.

Nobody is ignoring anything. I said that the Bird is a standard. It is a
standard,
is used as a standard, and will be used as a standard, as others have
pointed out.

In the CB community, it is about the best thing you can get. Some people
are more fortunate to have better, but for them / us, it is what we use.

I hate to nitpick, but in mathematics, the word AND signifys a decimal.

So two hundred and forty two would actually be 200.42

>

Its called logarythmic (sp) speech processing. It keeps the negative going portion of the modulating signal from completely cutting off the RF carrier.

Commercial stations have been doing it for years.

>
> >Or are you stating that the broadcast engineers are running all these
> >commercial am stations wrong now?
> >
> >They employ overmodulation... On positive peaks only.
>
> I don't think so, Toll. Like you say to me all the time, don't talk
> about stuff when you have no idea what you are talking about.

lol.

That has been common knowledge for years, and some of the CB shysters have actually
employed it to sell clipper, etc. type kits.

It is common to find a AM station going to 125 percent modulation on the positive peaks
of the modulated rf waveform, but still keeping the negative going peaks at or near 100 percent.

http://www.broadcast.harris.com/transmission/radio/dx-destiny.pdf
http://www.broadcast.harris.com/transmission/radio/gates-brochure.pdf
(designed for 130% positive peak)
http://www.broadcast.harris.com/transmission/radio/dxlw-brochure.pdf (peak modulation at 145 %)

And to put it in real perspective.....

http://wmbr.mit.edu/tech/CFR73_1580.pdf

AM Stations (73.1580)
1. In no case shall the amplitude modulation of the carrier wave exceed 100% on negative peaks of frequent recurrence, or 125% on positive peaks at any time.

Anyway, people get the idea. Limit the negative going component, and you can raise the positive going component to 125 percent.

reading.

Look above. I have listed a bird page that shows you use their PEP reading
meter (and only one)
to measure AM power output.

Hrm.

Your meter saying peak is of no concern to anyone on this group.

And this has what to do with someone in a CB newsgroup referencing a bird
wattmeter in relationship to
a power measurement?

Your tangents are getting old.

It isn't being underdriven, it is being driven correctly for the class of
service.

I have tubes here that have 0 watts of grid dissipation. By me putting them
in AB1, I am
underdriving them?

Yet another case....

The tubes are bigger but the signal is cleaner, the drive
> amp is simpler and the entire system is more reliable. Overall, it

Overvolting has nothing to do with the class of service on a grounded base
amplifier.

Please stick to the topics in which we where originally discussing.

> that's using the band?

lol.

I run my amateur equipment on the 11 meter band.

Ask any of the people that have talked to me on the newsgroup about my
operating procedures,
station, cleanliness in power, etc.

Your talking about something you know absolutely NOTHING about now. You have never worked me,
never heard me, and never will, I imagine, so how the HELL can you comment on how my station is run?

Without the consideration to potential hazards?
> Bragging about power when you don't even know where your power is
> going?

I run a spectrum analyzer on the output of my base station. I don't know where my power is?

Again, you have never seen my station, never operated it, and never heard it. What qualifications
do you have to tell me how it operates or where, or how it is endangering other people?

Are you God? Genie? Have psychic powers? What?

Adding to the ruin of what could be a great radio service?
> Claiming to be some super-tech but don't even understand the proper
> terminology? Yeah, Toll, whatever you say.

So far, everyone in this group knew what I was talking about but you. And that means I don't know
what I'm talking about.

> >Bird watts is a reference to wattage power output, as measured with a Bird
> >wattmeter.
>
> Ok, so what do your amps do in 'Drake watts'? How about 'Radio Shack
> watts'? Or whatever the FCC uses for their standard?

If I was using a Dosy meter to make a power measurements, I would add that it was
done with a Dosy meter.

You just stating that you get 10 watts out of your station is meaningless to rec.radio.cb

You don't have a leg to stand on, your entire argument is based on half-truths, outright lies (how my
station operates) and psychic abilities that I for one doubt.

>
> >Pill is a commonly accepted term for RF power transistor in the CB world
> >(this is rec.radio.CB, right)
>
> I thought it was slang for the transistors that bear the shape and
> color of aspirin, silly me. I guess that 2sc799 is also a 'pill', huh?

So when a customer brought me a dual MRF 477 amplifier and said it wasn't working, and
he thought a pill was out in it, he was wrong, right? It was a bad 477, but

he obviously knew NOTHING,
since he didn't know the transistor was in a different package than the
common (as you put it) aspirin package

(and I suggest YOU get it right. Toshiba has their 0WN sizing, and
designator. The CORRECT way
to reference the TOSHIBA devices is a 2-13B1A package).

After all, THIS IS REAL WORLD, not some sitting behind a desk. THE
customer referenced it as a
pill. Others on here have done the same.

Whats your point? That you like to argue semantics?

>
> >So, all your problems seem to be nitpicking, double standards, or just
not

> Although I would have to take issue with your use of the word "most",
> I can only guess. Does "Birds of a feather..." ring a bell?

Duhh.. ..... Hang in a CB radio newsgroup, that already has acknowledged,
acceptable verbage,
and then when you argue, and someone else steps to the plate to tell you
that it is accepted, they
are subjected to a week of your diatribes of psychic abilities, half-truths
and holier than thou
I am a degreed RF Engineer that hasn't operated a competition station ever
attitude.

Nice.

Actually,
> I think most that agree with you do so not because they understand the
> conversation, but because they don't like me, as tnom pointed out.
> That's not very good logic to be running down the coax and past your
> balls...

lol.

People here don't like me either. However, when someone is right, they are
right.

Unfortunately, this time, YOUR WRONG.

> >Notice topic: What is a bird watt... A measurement made with a Bird

> >
> >What is so hard to see about giving a reference to your measuring
equipment?
>
> Well you were making claims that it was the ultimate standard by which
> to measure a CB radio, when in fact just about any wattmeter will show
> the same thing.

No, not really.

Dosy reads REMARKABLY high.. That means so do the JB wattmeters of old,
since they where a direct rip off.

Diawa is OK, but not in the cb arena.

GC electronics.. Alas, they are all but gone.

CB is left mostly with the Pyramid companies, TEnna, etc... And their
equipment is HORRENDOUSLY inaccurate

As proven by putting a Bird inline with them as well.

So yes, it does tend to add credibilty in THIS forum for you to cite the
meter you made the reference with.

After all, would you want me to set up your stuff with a meter that COULD be
50 percent inaccurate? Or read that way on YOUR meter?

Mine could be 25 percent off one way, yours the other way.

However, most people that take care of thier bird meters can stick within
tolerance, and that is why it has become the standard which others are
guaged against in the CB community. It is the best available to the masses.

> >
> >How it's really done? Are you saying that I CAN'T get what I claim out
of
> >boxes?
>

> The problem is that you don't claim much, except that they will suck
> up lots of gasoline and airspace. Which I'm sure they do.

I did make a claim. You can't even remember what this is about, can you.

Your nitpicking that their is no such thing as a "Bird Watt".. I was citing
measurements of power.

lol

THAT, my friend, is a claim.

> >Did I state that? No. I also stated that I do spec-an and scope my
> >amplifiers.
>
> But you have never made any claims as to how clean they are. Do you
> have any numbers?

The point of posting anything here, dragging everything out and hooking up a
dummy load
(since station is down because of move) just to ingratiate you, isn't very
appealing.

Any third-party verification? Save it, Toll, we all
> know you are not interested in communicating with those things, just
> the "raw power" out the antenna.

Third party verification.. Yes, my roommate

Most, if not ALL of the Texas based stations, and a lot of the west coast
stations.

>
> >More lies coming from Sparky. Anyone notice that he starts making

> 'generalizations' only when they can no longer address the specifics?
> Ever notice how you change the subject when you lose your point? Or
> how you totally ignore it?

I haven't yet. The point is that we where talking about a refrenced
measurement, and yo ucan't handle it,
because it isn't in one of the books that control your world.

Or maybe its those psychic powers again... I dunno.

>
> >I'm just in it for the raw power and that's why I'm so much
> >> better than any EE because I can tweak more bird watts out of a pill
> >
> >Never said that
>

> Close enough. That was your attitude, and that's what I'm describing.

lol.

More generalizations that Sparky JUST claimed a few paragraphs ago he didn't
do.

>
> >> in PM FM mode
> >

Not always. Just in poorly designed transmitters.

>
> >I never said it would get you more watts from an amplifier.. That's your
> >doing.
>
> I was lumping your terminology into one phrase, in case you couldn't
> tell.

You where lumping about 3 different subjects into one sentence. Trying to
make someone
else look stupid, because yoru on the losing end of the debate.

>
> >and those professionals don't know what they are doing
> >> if they can't do what I do so they can't teach me anything
> >
> >
> >Never said that, either.
>
> Again, that's your attitude. YOU were going to teach ME some things
> about amps and RF, remember? YOU were the one that claimed I never
> went to a keydown so I didn't know what I was talking about. YOU were
> the one that thought I didn't even know anything about power RF. It
> all adds up, Toll. Flip through enough pages and you can usually
> understand the plotline.

I didn't say you didn't know anything about rf, I said that you had no idea
what you where talking about
in the world of overvolted, overdriven, balls to the wall rf that we play
with.

And you don't.. You admitted that. Please don't try to paraphrase by interjection of comments I didn't make, or bending them to fit your wants and needs at that particular moment in time.

> No, you said it was some super-standard for CB amps,

It is. Its a meter that I can trust that if the other person takes care of their slugs, they will get a near duplicate power reading.

I can't do that with a Dosy meter. Its too different from production bath to production batch.

like a 'Bird
> watt' is a better thing than any other watt.

That has nothing to do with what I am saying, thats something YOU added AGAIN.

The only thing a Bird Watt tells someone is that I am getting X amount of watts,
as measured on my Bird wattmeter.

Bird tolerances are close enough to where someone else will get identical, or near identical, readings
with the same equpment.

What DON'T you get about that?

>
> Paraphrasing, yes. Untruths, hardly. All my conclusions are based on
> what you have said.
>

No, none of them are.... And other people, in other forums are laughing at you about it.

> >Makes you a LOT more credible in the future.
>
> My credibility is not your concern, but maybe it should be. I don't
> care what people think about my attitude, just as long as I get the
> facts straight.

Well, when you start, the credibility follows.

When I'm wrong I admit it, like with the PEP meters,
> and the co-phased antennas. You have pushed this whole thing so far
> that you don't even remember what the issue was. So let me refresh:
>
> You poked your nose into a conversation comparing 50 volt transistors
> to 12 volt 'pills', claiming the 12 volt devices could be overpowered
> so much better while retaining spectral purity,

Spectral purity?

and implying that PEP
> 'Bird watts' was prima-facie proof of quality.

No, I never made that statement either.

If your going to quote me asshole, quote me. Your paraphrasing is BS.

I called you on both
> issues, and so far you have proven nothing, except that you really
> don't know as much about RF as you claim. Care to continue?

Yeah.

Quote me, and stop paraphrasing me, and this conversation will continue.

Until then, your a liar. Live with it.

lol

The bird meters used in CB radio all use interchangable elements.

Therefore, they are all interchangable.

This was just more of your arguing semantics.

Sorry Sparky, until you stop arguing semantics, I refuse to answer your posts anylonger.

Quote me, and quote me correctly, and stop with the paraphrasing. You make it impossible to
debate a point, because you never make a point. You paraphrase someone elses paragraphs, posts
relating to posts, relating to posts, and then try to entagle them with something never said.

Again. Quote ME, and we can continue. Until then, your a liar.

I didn't say that, did I. More paraphrasing and lies.

The 43 is the meter used in Cb circles.

If you didn't know that, its your own fault.

Of course you will have line loss at 150' but you didn't specify the type of coax you use so a db loss figure cannot be quoted. rg 213 would be ok up to 100' any longer than that is up to you how much loss you are willing to accept. If not go with lmr 400 or equivalent.

> those 2 watts on the sidebands don't show up on an RMS meter.

I already did.

However, for the Aged amongst us...

When dealing with the average heating power, you have a carrier (at 4
watts), and 2 sidebands at a watt each (this assumes 100 percent symmetrical
modulation).

One of them is negative going, and the other positive (speaking relatively
to the spec-an), or one of them is positive half, and the other negative

half of the modulating waveform.

Since they are symettrical, they cancel themselves out of the heating equation, leaving the carrier again.

4 watts, + 1 watt - 1 watt = 4 watts.

Your losses in some decent coax like 9913 Belden would be about 1.5 db for
that run. While you are at it, bury it. Figure about 0.7db/100 ft at 30
MHz. You could cost yourself more with some extraneous connectors so do
it in one piece. BFD

Don't start backpeddling.

We told you, the RMS (as you call it) or AVG (as Bird calls it) meters DON'T measure AM power effectively.

YOU wanted to know WHERE BIRD stated that. I provided the url.

OK, your right. I did.

Sorry if memory failed me. At least I have the decency to not twist words,
misquote, etc.

Glad to see you finally did quote correctly, though.

This has nothing to do with the REST of the conversation, though, as I only
reference to my own equipment..

The Bird gives SOMEONE ELSE a reference, as well.

Lets not forget the point of the entire conversation :)

My my, Nebout speaks! And when did you finally decide to come defend
Toll? When you finally understood something?

Maybe you should read the first post in this thread. I didn't write
it, somebody else did. I thought it was funny so I posted it. But
considering all the hype about "Bird watts" being some jaw-dropping
pinnacle of technical prowness to which every CBer should bow down and
kiss the ground in reverent admiration, maybe it's about time to slap
a few faces:

A watt is a watt is a watt. You can measure it with whatever you want,
you can pray to it before you go beddy-bye, you can curse it until
your face turns blue, but it's still just a WATT. A measure of power.
Check this out:

1 BTU/sec = 1054.8 watts
1 ft.lbs./sec = 1.3558 watts
1 hp = 746 watts
1 Kcal/min = 4186 watts
1 Lumen = 0.001496 watt

Now how do you convert all those into "Bird watts"? You don't, they
are the same!

How reliable is a Bird wattmeter? Very. How accurate is it? Depends on
the tolerance of the slug. And just like ANY OTHER wattmeter, it could
be dead-on. Or it could be off. It could also be off beyond the
accepted tolerance, while that el-cheapo meter could be dead-on: I've
had to throw away a few slugs over the years.

But here's the big question: What do they measure? They don't measure
the power going out the antenna, they don't discriminate between the
fundamental and the harmonics, they don't know how efficient your
equipment is. The truth is, they only measure what the operator using
it wants to measure! Which, in keyclown circles, doesn't mean squat!
And do you know why? Because the wattmeter is only a tool that
provides a -guideline- to RF power, that's all.

Look at the posts in this thread. Do you see how often I ask Toll what
the standard is for RF power by the FCC? Do you know why he couldn't
answer it? Because he was too lazy to find out that the FCC measures

RF power with a FIELD STRENGTH METER that measures microvolts/meter at a given distance, NOT WATTS! And THAT'S how RF power is properly measured!

So now you can quit taking that Bird wattmeter to bed with you every night, because it isn't the end-all-beat-all of human existance!

1784. Newbies Bombarded By Illegal Advice?

Newsgroup: rec.radio.cb
Date: 2002-01-13 21:27:32 UTC
From: voobner@yahoo.com
Message-ID: <fbc7a2.0201131327.1bf0daf2@posting.google.com>
Source record: 112027

I don't know if you guys notice this, but I do.

Newbies drop in to rec.radio.cb and ask a question about 'what radio to buy' or 'how to get more range'. Immediately they are "bombarded" with advice from illegals like Nebo, Train, Jay, and others openly telling them to get amps or export radios. Others like Landshark, Scott, Doc, etc. are more sneaky (or chicken, depending on how you look at it) and add a disclaimer about the illegality before giving detailed instructions on how to break the law. Now bear in mind that these folks I named are newsgroup REGULARS, meaning they hang out here all the time so chances are pretty good a newbie will run into them.

To their credit, two "regulars", Jerry O. and Dick M. (to a lesser extent) will usually advise a newbie against illegal operation. However, they have learned to choose their words carefully, and will only dispense advice in such a way as to show respect for the illegals and not rile them.

Of course, depending on how Dick and Jerry O. are feeling that day, a newbie may or may not get a balanced view of CB when he asks a question.

Anyone else (me for example) who refuses to give the illegals proper respect or sugar-coat the facts about illegal operation is called a troll, or worse. No wonder there is so much strife in this NG.

Hello Monarholic:

I have guys using 200 and 300 feet of LMR-400, "and is not a problem G.I."

The small amount of loss, will be insignificant. The thing to be concerned with is the several dB, of insertion loss in the normal Impedance Matching Devices, inside the antenna.

Keep the antennas away from other metal objects, and away from power lines.

Rock on Dude. Its a FCC rule to listen to Rock n Roll during Antenna construction times. And the Beer light should only be turned on after the SWR is adjusted to the okie-dokey scale!

Jay in the Mojave

The RMS voltage of a sine wave is 0.707 of the peak. That factor is different if the wave is not a sine, but the sine allows easy calculation. The 'average' of a wave is taken with 180 measurement of peak voltage at each degree of half the wave, and those values are averaged. When the wave is a sine, the average is 90% of the RMS value. If you want a reference, let me know, I have several.

>LOOK IT UP!

Now you are trolling, so I guess I have to write it out. Power equals voltage times current. Peak-to-peak power is equal to peak-to-peak voltage times peak-to-peak current. Get it? PEP = Vp-p * Ip-p

Like I said before, this is a SSB fundamental. Maybe you should have taken my suggestion and looked it up yourself. I can provide many references for this as well.

THHN is gasoline and oil resistant wire. I put lugs on my wire,
crimp and then solder them to seal and keep resistance low.

I get mine at the local Home Depot hardware store.

Uh huh. Just RMS? Just an adjective? Lets see just what the term "Bird
watts" really means:

Get the ICOM IC-78 about 560 if you want a base station radio or even
mobile, but it thats a lot, I suggest the Galaxy Series like the DH88
series, you can get those for about 300 dollars, I posted a review on
the IC-78 radio you could search for that in dejanews if interested.

so basically I say
560 dollar range a ICOM IC-78 commercial radio (RMS AM 40 WATTS, 100
PEP SSB)
300 dollar range a Galaxy DX88H (RMS AM POWER 8 WATTS, 30 PEP SSB)

>of a sine wave. If it is any different than 0.707 of the peak value,
>post it. These are constants that you can find in just about any
>textbook. Try it.

The problem with you is that you DON'T understand that this .707
value is only used for voltage, not power. You think there is a direct
relationship between a peak voltage and peak power. There is not.
A peak power measurement still uses an RMS voltage times an RMS
amperage.

And that is what you don't understand.

>Oh hell;
>
>"The concept of -dc input power vs RF output power- does not apply

Not

>PEP = vp-p * Ip-p
Not

>Power equals voltage times current. Peak-to-peak power is equal to
>peak-to-peak voltage times peak-to-peak current. Get it?
>PEP = Vp-p * Ip-p

No I don't get it. You should go back to the books and maybe you'd
get it.

PEP ="The average power supplied to the antenna transmission line
by a transmitter during one radio-frequency cycle at the highest crest
of the modulation envelope , taken under conditions of normal
operation."

PEP = Pev in rms squared then divided by Z.

Where Pev = peak envelope voltage = rms voltage at peak modulation.

Get it?

Sparky you should go back to the basics and maybe you'll see you
have a misguided understanding of AC power. A 100 watt 117volt
rms 60hz light bulb draws .845 amps rms. It also can be said to be
165 volts peak or 330 volts peak to peak. However wattage measurements
always use RMS values of voltage and current. If this wasn't so then
our light bulb would be 200 watts peak and 400 watts peak to peak.

That number is two hundred and forty-two one-hundreths. Two hundred
and forty-two are two seperate numbers.

>Its called logarythmic (sp) speech processing. It keeps the negative going
>portion of the modulating signal from completely cutting off the RF carrier.
>
>Commercial stations have been doing it for years.

Not in the RF circuits. That's all part of the audio processing done
-before- it hits the modulator. In broadcasting, the modulators are
not clipped. Audio is passed through a delay line so the limiter's
feedback stays ahead of modulation, and the audio isn't distorted by
soft or hard clipping. But AVC is rarely used, and compression only on
the vocal mics, well ahead of the modulator. Like I said Toll (and you
did too), don't talk about something you don't know anything about.

>Anyway, people get the idea. Limit the negative going component, and you
>can raise the positive going component to 125 percent.

There's a reason for that, you know. It's called "transient
suppression", and it's not intended to allow overmodulation. If some
do that, that's how they operate, not me. But it's not the way they
should be operating.

>I have tubes here that have 0 watts of grid dissipation. By me putting them
>in AB1, I am
>underdriving them?

Compared to what the tubes are capable of providing when you draw grid
current, and not even coming close to the maximum anode dissipation,
yes, they are underdriven.

>Yet another case....

Now we are getting to the crux, and I deleted most of the post just to
focus on this: If you cite the measurement tool as a Bird, why don't
you cite any other wattmeters you might use? Or any other measurement
tools you use? Does your battery put out Fluke volts? Are your
frequencies measured in Schulmberger MHz? Do you even see what I am
getting at here, Toll?

Now that was direct, concise, and comprehensive answer! And well
stated, too! Now maybe you can explain all the inconsistancies with
the use of the term.

Well a 'modulating' signal would have 50% of the power on top and 50%
below, ideally. How do you seperate the power in the peaks?

Yup, but somewhere back in the Sanctum Sanctorum where Red the Super-Tech
down at Happy Joe's Truck Stop, Funeral Parlor, and Emporium of CB
Delights does his thing there is a meter that will call a 100 watt bulb a
2 or 4 hundred watt bulb and heads will go up and down and wallets will
miraculously tumble from pockets. Hallelujah, I am healed!

I run 250 feet of LMR 400 and RG11 to 2 x M104 's and it works great.The loss is low with this type of coax .I had RG 213 on it before and I noticed the difference when I switched.You can use standard connectors with LMR 400 which is a plus.

Go look up the average value for a sine wave. If it is any different
than 0.636 of the peak value, post it. Then go look up the RMS value
of a sine wave. If it is any different than 0.707 of the peak value,
post it. These are constants that you can find in just about any
textbook. Try it.

Hey guys I've been thinking about installing my beams next to an
outbuilding of mine. My question is about the coax run,it is aprox 150
feet from my home. Will line loss be a problem? Or any other advice
would be appreciated. Thanks in advance.
--
~Moparholic~
Your losses in some decent coax like 9913 Belden would be about 1.5 db
for that run. While you are at it, bury it. Figure about 0.7db/100 ft at
30 MHz. You could cost yourself more with some extraneous connectors so
do it in one piece. BFD

-
I was at 130 feet at one time so it shouldn't make a huge difference
with quality coax. If you are going to bury it, encase it first. Even
though some jackets are made with PVC, PVC tubing works great as addded
protection plus helps keep the critters away from it. I use some steel
wool around the coax at the ends of the pipes where the coax exits after
shoving a few moth balls (It was tough getting their tiny legs apart to
rip 'em off) in each end first. I also made a neat through the wall
tubing for my coax and rotor cable in this manner.

Well, I'm one of the newbie posters. But I want all the info. I'm stuck with the descision of buying a low power AM/SSB CB for $200 and maybe being disappointed I can only transmit 2 miles, or getting an export radio for the same cost that can transmit a little farther on CB and also have the capibility of transmitting on the "legal" band when and if I elect to get the no code license. I don't consider myself a lawbreaker, "Outlaw" or whatever. But, I like to think I am a savy consumer. From what I understand, if I want CB and I want to get my no code license and ham permission, I have to have two radios stacked in my truck to be legal?
I'm not being smart, I'm looking for answers and advice. I don't wish to transmit or play on the ham bands until I am licensed. But I'd like one radio that will meet both my expectations (ham and CB).
I don't think that's unreasonable, is it? I'm here to learn, let me have it.

OK, so you are saying that the stupid made-up terms (i.e. "bird
watts") used by "high power operators" (i.e. keyclowns) are also valid
among the engineering community? Gee Toll, sorry to say but I don't
think the IEEE journal or even a clerk at Radio Shack is going to back
you up on that one :)

it.

First of all, if you get your no code tech license, that will not give you the HF priviledges to use your export radio, to use the freq's in your "export" radio you need to have passed the code test as well.

Second, and everyone who disagrees wit this can flame me all they want, but it is illegal to use a 10 or ham radio on 11m (CB), all radios used for BC in the US have to be type accepted by the FCC. The FCC will not type accept a radio that transmits beyond the 40 allowed, or that will do more than the legal power set forth in the regulations.

I have a CB, and when I take my test, I will also be using a ham rig. Color me funny, but I was brought up to respect god, my country, and the laws.

1831. Power explained

Newsgroup: rec.radio.cb
Date: 2002-01-14 01:05:18 UTC
From: tnom@mucks.net
Message-ID: <l0744u0653vb0obles13si0390n7f42nv6@4ax.com>
Source record: 112067

Most on this group understand power, whether it's PEP, Peak,
Average or RMS. If you do then ignore this post.
****
Definitions:

MEAN Power of a Radio Transmitter.....Power supplied to the
antenna transmission line by a transmitter during normal operation ,
averaged over a time period sufficiently long compared with the period
of the lowest frequency encountered in the modulation. A time of 1/10
a second during which the mean power is greatest will be selected
normally.

PEAK Power.......The mean power supplied to the antenna
of a radio transmitter during one radio-frequency cycle at
the highest crest of the modulation envelope.

PEP or Peak Envelope Power of a Radio Transmitter......The
average power supplied to the antenna transmission line by a
transmitter during one radio-frequency cycle at the highest crest of
the modulation envelope , taken under conditions of normal
operation.

The only difference between PEP and Peak is that PEP stipulates
normal conditions. Peak has no such stipulation.
****
Quote:

"In the context of radio signals , then , peak power means maximum
average power. Peak envelope power (PEP) is the parameter most
often used to express the maximum signal handling capability of a
linear amplifier."

1989 ARRL handbook, page 2-12 and 13 under A-C waveforms
****

Peak power = PEP, which is:

Pev rms squared divided by Z

Where Pe refers to the peak of a modulation envelope, not the valley,
and the v refers to the rms voltage value. Z = resistance (50 ohms in
this case)
****

Mistakenly some use this formula for PEP

PEP = peak to peak voltage times peak to peak current.
This is wrong. Here is why. Time to plug in some numbers.

A 100 watt carrier has a peak to peak voltage of 200.
A 100 watt carrier has a peak to peak current of 4.
200 volts p-p times 4 amps p-p = 800 watts PEP

This same carrier modulated to 100% will have a peak to
peak voltage of 400. And this same carrier modulated to
100% will have a peak to peak current of 8.
400 volts p-p times 8 amps p-p = 3200 watts PEP

WRONG!
****
Others mistakenly use this formula for Peak power

Peak power = peak voltage times peak current.
This is wrong. Here is why. Time to plug in some numbers.

A 100 watt carrier has a peak voltage of 100.
A 100 watt carrier has a peak current of 2.
100 volts peak times 2 amps peak = 200 watts Peak

This same carrier modulated to 100% will have a
peak voltage of 200. And this same carrier modulated to
100% will have a peak current of 4.
200 volts peak times 4 amps peak = 800 watts Peak.

WRONG!
****
Here is the correct formula

PEP = Pev rms squared/Z
PEP = * Volts rms times Current rms
* measurement taken at a modulation peak

So if you plug in the numbers then you'll see this:

A 100 watt carrier has an rms voltage of 70.7
70.7 squared/50 = 100 watts PEP

This same carrier modulated to 100% will have a rms
voltage peak of 141 volts. Or 141 squared/50 =
400 watts PEP

RIGHT!

As far as RMS power.....It is a recognized term but
technically an incorrect way of identifying power. RMS power
is understood to be the average power.

Your questions are reasonable. The straight answer is one radio for CB and ham ARE illegal.

It would be nice if it weren't, but it is the way it is. The logic behind this is that Amateur radios
do not have to be FCC approved and CB radios do. So when you modify, for example, a
10 meter radio to work on CB, or have 'extra' channels and power, you have voided the FCC
approval for its use in two ways.
1) It no longer meets FCC's criteria for use under the rules because:
a) it was never approved for that use in the first place.
b) it has been modded so that it no longer meets its original use.
c) it fails the criteria for CB either because it has too much power, operates in BOTH
services, or has "extra" channels.

2) It has a frequency readout instead of the 40 channel increments of an approved CB
radio.

I have an Icom 706 MKIIG that *would* transmit on 27 MHZ. Even if I reduced the power
to 4 watts, it is still illegal to use it for that purpose. I would like to be able to do that, but I
cannot and expect to hold onto my license. I hope this helps.

Jerry

No flame intended but the no-code license does not authorize 10-meter operation. As a matter of treaty, which is not going to be modified for about two years, Morse is required at 5wpm in the US below 30 MHz. The code requirement will more than likely but no guarantees be scrubbed at the next treaty meeting.

The usual 3 websites:
http://www.arrl.org
http://www.qrz.com for sample tests,
http://ah0a.org for Morse Academy

Several of the groupies have done the Extra recently and can be of help to you.

As far as hardware, your understanding is correct if you propose to be legal. Equipment sold for CB (and virtually every service except Amateur) has to be 'type-accepted' or certified and could not be so blessed with Amateur capability. You can modify a CB to the ham bands and transmit if so licensed but you cannot go the other way.

Feel free to use my e-mail.

Dick N&#65533;BK ancient Extra

Without knowing where you live it is customary to go below frost line to keep your pipe from growing out of the ground in the spring. Other than that, have at it. Run enough pipes for all the loads you anticipate and add one more.:-)

When I lived in WI the project would have required bringing in a load of dirt and disposal of a load of rocks brought up by the trencher. May you be more fortunate.

Belden and others -- Belden is just easier to get here in flyover
country -- make a lot of kinds of coax. 9913 is a polyeth core, PVC 1
jacket of the RG-8 type. Aside from the jacket being polyeth and a foam
core LMR400 looks to be identical. Belden likes pvc jackets.

RG213 aka Belden 8267 with a #13 flex center instead of a #10 solid has
about twice the loss of 9913 but does use a non-contaminating Class 2 PVC
jacket.

Moral of the story, Mope, do your homework.

Incidentally, LMR numbers seem to be the diameter of the coax.

It's not really an issue of power and distance you would be able to talk when looking at a CB or a 10 meter radio. While a higher powered 10 meter radio (along the line of a RCI 2970) would afford more power, it would also fall beyond the price range you are looking at. The small amount of power you would get from buying a regular 10 meter radio is also about useless. The reason I would tell a person to buy 10 meter over a regular CB is if they are going to use it out of band, then buy a radio that was built for that use. I see no reason to add channels to a CB when there are much better offerings out there that already have these options available as an integral part of the radio.

Moparholic,
I would suggest that you find a fairly late edition
of the Radio Handbook and take a look at the table of
different types of coax. It has the loss in db per
one hundred feet for each type of coax, along with
several other interesting facts. Decide what you want
to use and have at it. The only limiting factor is
your wallet...

> not peak power.

This is where you are wrong. Peak power is an average power
that is specifically measured on a modulation peak. Hence the word
"peak" Peak as in modulation peak, not as in voltage peak.

>I also understand that you can't even pick up a textbook
>and read the basics. We'll begin with some SSB fundamentals in your
>new thread.

You are the one without the basics. Do me a favor. Look up the
definition and the formula used to determine Peak power. I already
know what they are. You're just assuming you do.

>BEFORE you go any further, you REALLY need to get some basics inside
>your head so you know what you are talking about.

I have no problem with your above statement. It is correct. However
how does it jive with YOUR formula.......PEP = V p-p times I p-p ?

You already said, and I agree, that a two tone SSB signal has a
quadruple Peak power and twice the Voltage amplitude of it's
CW counterpart. If we take this information and plug it into
YOUR formula then we can see YOUR flaw.

Since 2peak = Peak to Peak then

PEP = 4Peak Voltage Times 4Peak current = 16 times the original CW signal.

This is incorrect of course. PEP, Peak and Average power measurements all use rms values. Not Peak or Peak to Peak.

1-13-02
First, there was a 77-861 and a 77-861B model. Sounds like you have
the original because then "B" version used an IC audio power circuit,
not transistors.

The pair of 2SC1096's are the audio power amps you're looking for, in
a standard push-pull audio circuit. The driver for this is TR12, a
2SC945 and TR11 (2SC945) as a pre-driver on RX and a mike amp on TX.

The 2SC1760 & 2SC1239 are the RF POWER driver & final; don't touch!
Doesn't sound like your problem.

All this info is in the Sams CB Fotofacts #188 for the 77-861
schematic. You can try buying a photocopy from Sams at: 800-428-7267,
or www.samswebsite.com/photofacts.html

I understand that RMS voltage times RMS current yields RMS power, not
peak power. I also understand that you can't even pick up a textbook
and read the basics. We'll begin with some SSB fundamentals in your
new thread.

Um, when the mean power is greatest? Mean = average. They are
synonyms. You are saying something like, "pick the highest average
power", which is like saying, "I'm the most outstanding normal
person". It makes no sense. And where did the value of 1/10s come
from? Is that arbitrary? Or is there a reference for that figure?

>PEAK Power.......The mean power supplied to the antenna
>of a radio transmitter during one radio-frequency cycle at

Alright, you are making this up as you go along. The "mean" power on
the peak?

>PEP or Peak Envelope Power of a Radio Transmitter......The
>average power supplied to the antenna transmission line by a

>**

Agreed, and the argument about the semantical difference is what I was
trying to avoid when I conceded the point to Toll. Now you want to
take issue with it while defending him? Hmmm...

>
>Peak power = PEP, which is:
>
>Pev rms squared divided by Z
>
>Where Pe refers to the peak of a modulation envelope, not the valley,

>this case)

Well that totally contradicts your statement saying that PEP has
nothing to do with Vp-p. Vrms = 0.707(Vp-p/2), or did you forget?

>**
>
>Mistakenly some use this formula for PEP
>
>PEP = peak to peak voltage times peak to peak current.
>This is wrong. Here is why. Time to plug in some numbers.

Save it, you need some SSB fundamentals first.

For starters, modulate an SSB with a single, constant-amplitude,
sinusoidal audio tone. Using the resulting RF voltage peak as a
reference, modulate the SSB as before but with two tones of the same
amplitude, but at different frequencies. The two tones will mix,
causing an envelope with twice the voltage amplitude created by a
single tone. Now if the voltage peak is twice the amplitude, that
means the peak power is quadrupled without changing the amplitude of
the audio signal, right?

Now that I have raised a few eyebrows, notice the use of the word
"envelope". If you look at a single-tone modulated AM signal on the
scope you will see an envelope that varies in amplitude with the
frequency of the tone. Now look at a single-tone modulated SSB signal.
It's flat like a CW signal!

Now try it with the meter. Single-tone modulate an SSB and measure
PEP. Then do it with a two-tone signal of the same amplitude. And
again with voice. See the difference? So which PEP reading is correct?
They all are, because you are measuring the peak of an SSB envelope,
NOT an amplitude-modulated carrier!

BEFORE you go any further, you REALLY need to get some basics inside
your head so you know what you are talking about.

>That equation is taken directly from the next line after the quote in
>the Kellejian text. You may consider it to be fact. Now it's up to you
>to resolve your own temporal conflicts, because I'm tired of repeating
>myself every time you don't check the facts for yourself.

The first part is all that is needed.

PEP = Vp-p * Ip-p

If this was so then take a 100 watt carrier at 50 ohms.
and give us it's PEP

Additionally take this same signal and 100% modulate it
and give us it's PEP

The problem is that your reference is not referring to the Peak
Envelope Power of a transmitter. It is referring a Peak to Peak
power that has no use in RF power measurements.

nope all existing Radios with AM will be grandfathered in, Only new
Manufactured radios will require meeting the above specs in order to
be type accepted (SSB+350HZ stability). BTW there are also plans to
lock out 26-27.995 in the CPU firmware in all Radios to be type
accepted for HF HAM use, Im not sure if this is going to pass though.I
have an inside source.

Over here, the radio it's in is a Major M65A but I doubt that anything like that will be known in the US. Local badge engineering, I suspect. From some rather sketchy info I managed to surf up, the same board may have been used in some Hy-Gain models.

The radio is a 9-channel AM set, uses the PLL02A with 3 crystals and I'm trying to find out what the crystal frequencies are, hence the original post. Most likely the usual 10.240Mhz PLL with 11.0525Mhz and 10.695Mhz mixers but "which one is which" (X101,X102,X103) is what I'm after. The xtals don't have markings on them.

"9 channels???" Yes... over here we're only allowed 9 channels for CB. The channels match ch19-27 of the USA allocation with 19 being 27.185Mhz etc.

Sean.

SSB Lesson #2:

Remember how Toll explained how sideband powers cancel? So if you have only one sideband, then the power on that sideband isn't canceled, correct? Ok. Now, drop the carrier. What's left? Sideband power only, and it varies from 0 to the maximum (peak) value of sideband power.

But we have another problem. Since the sideband envelope is more like a non-sinusoidal audio frequency, you can't find true RMS power with a meter that only accurately measures sine waves (tech spec RMS meters are just averaging meters recalibrated for RMS values, but that only works when the signal is a sine wave -- remember .636 and .707?) So we need a different method to measure SSB power.

How about a peak-reading wattmeter? Well, that's one choice. What a peak-reading wattmeter measures is the maximum amplitude of the signal. With that we can find, well, the maximum amplitude of the signal. And the peak of an SSB signal is only the carrier power less the modulation power. Add a long delay to a peak-reading wattmeter and you can see that it has a purpose, but mainly for the engineer trying to make sure his final isn't overvolted. That's about it.

So how do we read the total power of an SSB signal? With a PEP meter, of course. The difference is that while a peak-reading meter will measure only the modulation peaks, the PEP meter meausures the total power of the -envelope- at any given time, hence the phrase 'peak envelope power'. Both carrier and modulation are included in the measurement.

Now picture the sideband on a spectrum. No audio, nothing on the spectrum. But add a 1kHz tone modulation, and a spike pops up. That spike is 1kHz away from the missing carrier. Now add a second tone, say, 2kHz. What just popped up? What did that do to the total power of the sideband signal?

Picture the same spectrum, but add a carrier. Remembering that both sidebands cancel each other's power, how does the power change when you modulate with a 1kHz tone? Two tones?

Stay tuned for lesson #3, where we begin formal sideband analysis. Or, it would sure make my keyboard happy if you could learn something for yourself. I think that's the better way, that way you wouldn't have to put up with me any more, don't you agree?

You need to specify what is being averaged, the RF or the modulation? Then, what peak is being measured, the RF or the modulation? You have done neither. AC power, when measured RMS, refers to the power of an AC signal. RF power would naturally refer to the power of an RF signal. Modulation power would naturally refer to the power of a modulating signal. Wanna give your definitions another try?

oh come on dave. the quarter and a dime radio is a problematic radio
at best and oh please give me a break.....chip switch........??? i
don't think so....the galaxy is a problem too.....what is the deal
with the frequency drift on those damn things? i read something on
their website about it........

First off, it's not -my- formula. In case you didn't notice, that came out of a highly-regarded university-level textbook on the subject.

>You already said, and I agree, that a two tone SSB signal has a

No, not true at all. Peak power and peak evelope power is -derived from- and -calculated with- the peak voltage and current levels. Take a step back in time and review how to obtain DC PEP measurements. That will explain a lot.

I gave the equation earlier, but here it is again in case you missed
it the first time:

PEP = Vp-p * Ip-p = 2((1.414^2) * (Vrms * Irms)) = 4Prms

That equation is taken directly from the next line after the quote in
the Kellejian text. You may consider it to be fact. Now it's up to you
to resolve your own temporal conflicts, because I'm tired of repeating
myself every time you don't check the facts for yourself.

Stop avoiding the question. You can not use Vp-p * Ip-p = PEP
Where PEP is the Peak envelope power of a transmitter.

You can use Vp-p * Ip-p = PEP if PEP is the Peak to Peak
measurement of power. However this Peak to Peak measurement
of power is an instantaneous measurement that is not used in standard
RF power measurements.

"Peak Envelope Power of a Radio Transmitter......The average power supplied to the antenna transmission line by a transmitter during one radio-frequency cycle at the highest crest of the modulation envelope , taken under conditions of normal operation."

The above quote is taken from a standard electronics dictionary. The ARRL handbook basically says the same. So does the BirdWatt.jpg

A 100 watt 117volt rms 60hz light bulb draws .845 amps rms. It also can be said to be165 volts peak or 330 volts peak to peak.

Do you agree with this bulbs I and E above? I hope so because that's about as basic as it gets.

Standard wattage measurements always use RMS values of voltage and current. If this wasn't so and we used your formula then our light bulb would be 200 watts peak and 400 watts peak to peak.

What I have been trying to say, and you have trying so hard to avoid learning on your own, is that if you want to measure the power of an envelope, you must first figure out what that envelope is made of. They are different for AM and SSB. Once you learn the difference, then you will have no problems understanding these discrepancies. Until then, you will be just treating any sideband as if it were a modulated AM carrier, and that's not the case.

Now this is the last time I will say this, so I will be very explicit: Go to the public library (make sure you go there when it is open), locate a good book on Electronic Communication, check it out, take it home, and study it. Read that puppy front to back. If you need to clarify anything, don't hesitate to ask me, or Dick, or anyone else that didn't get their education from the back of a Suburban. Because it isn't easy to teach someone how to swim when they don't even know how to get wet.

Noise canceling mic.......Astatic 636L or for a few more bucks Turner Road King 56.......AKA.....RK-56.
Speaker would be a choice easily made by you but go for a larger style to help overcome some of the noise in the cab.
Train

Sounds good to me. Notice the breakdown:

Average power...one RF cycle...highest crest...modulation envelope.
Those are key phrases, but work backwards: start with 'modulation
envelope' and work your way back to 'average power'.

Yeah I get it. You're just a troll uninterested in the truth. Just interested in protecting your own pride. So insecure that you can't admit when you're wrong? So insecure that you won't admit that.....

Vrms times Irms = PEP (peak envelope power of a radio transmitter)
* measurement taken at the modulation peak

If you can't come clean now, then how can you expect any one to believe anything that comes from you?

Hey
i noticed you were going to have multiple feedlines......
why wate your money install an Ameritron 4 or 5 connection switch box on your tower remoted to your shack. then you only need 1 feedline run to the shack. they run about 130.00 the extra monies you would have spent on coax would pay for this. yess 9913 direct bury is the best way to go as long as your not running over 2kw.

hi
go to qrz.com look under shareware programs down load the diple program
it will tell you what you need to know.
you will also need to download dll.100 to run it if your computer doesnt
have it.

> explain this a little better, how can I have power below 50 watts 50% of the
> time.

A properly modulated, symmetrical 100% modulated signal will show little
or no change in reading on a true average reading or RMS wattmeter. The
reason for this is that although the power of the carrier will increase
4 times the dead key power on peaks (in your case 200 watts), there is
an equal dip that drops to near zero power. The two will average out
(assuming a sine wave), and that is the reason you don't see any change
in wattage.

If you have an average reading meter that does increase (like in your
example), there are usually three common causes for this:

1. The modulation is exceeding 100% by a great margin. A 200% modulating
signal (assuming enough modulator power or amplifier headroom) will
allow the PEAK power of the sinewave to rise above the normal 4X peak of
a 100% modulation waveform (8x in this case). The negative side of the
sinewave cannot go below zero power, and is cutoff there, so the duty
cycle of peak to trough power is changed and is no longer balanced, and
will show an increase in power on the RMS meter. Since the negative
(trough) side of the sinewave is clipped, it will cause splatter and
distortion, and is not a recommended method of modulation, unless there

are sophisticated filters and processors that shape the waveform before the modulator, but that level of sophistication is normally not cost effective for the average CBer. This is the type of modulation that is usually associated with "swing kits" (without the filtering and processing).

2. The second cause is merely an asymmetrical modulation waveform, in which the positive side is greater than the negative side (The wave is offset). This is also difficult for the average CBer to reproduce.

3. The third method is called controlled carrier. Special circuitry inside the radio is fed with a rectified portion of the modulating waveform. As the modulation increases, the rectified voltage increases, and is applied to a power regulator which varies carrier power to increase in proportion to the modulation peak. This gives the overall effect of greater peak power, but the modulation power is no greater than normal, it's just being boosted by a higher peak reference carrier. The greatest advantage to controlled carrier, is lower current consumption. When you are not talking, the carrier returns to a "rest" state, at a lower level, thereby saving batteries, or dissipating less heat in the final amp. When you speak, the carrier rises to the designed level, for the duration of the modulation.

My guess is that you are seeing the effects of a "swing kit" which is why your meter is showing forward wattage gain with modulation.

chris,take 2 wires,#12 guage,cut them to 8'-6" in length. take one of the wires and solder it to the center conductor of the coax. insulate this solder point with heat shrink tubing or electrical tape. next solder the other piece of wire to the braded or shield portion of the coax. insulate this as well.(you dont want the two wires to be able to short together(very bad for finals)! you now have a functional dipole antenna.this thing can be hung vertically or horizontally. this will work on the other bands as well,but remember,if you go up in frequency (upper 27 mhz) youll need to shorten the wire. if you go lower in frequency(26 mhz.) youll need to add length. the lengths given should approximate the 40 cb channels.you may need to "slightly" lenghthen or shorten the wires to get a swr of 1.5 or less. one final note,when stringing this antenna up,use a non conductive support system,ie string,plastic tie wraps etc to hold the wires,do not allow the wires to short to any other surface.while this system may not be the best,ive talked thousands of miles on a simple wire antenna just like this,when it wasnt possible to put up anything else!!! good luck.and good dx-ing , elpasogunslinger

Line loss is always a problem. RG-213 and RG-8 would suffice for your
application, avoid RG-58 and use RG-8x only as a last resort.

Midland is a basic CB, modifiable, but basic. Galaxy makes a good radio but are sensitive to temperature changes and mobile use may rattle screws loose in big rigs. I will say many radios can't hold up to the rattle and shake of a semi.

Well Midland are a very basic modifiable cb, but
they do stand the test of time fairly well. I know a
couple of truckers that have Galaxy's, they've had
no problems. On the other hand, some locals have
had nothing but problems in the 4X4 with not holding
up to the rigors of off road.
I prefer the 2510, I've had one for about 19
years now, and still running strong.

I agree with Train, though I lean
towards the Turner. I have found that it
is less likely to cause feedback.
Midland and Uniden both make a
pretty good External speaker, also
RS sells one that ok.

Hi Keith. I wasn't going to bring it up, but the cat seems to have got
your tongue concerning your subject of an "internal" investigation
regarding cb interference to emergency and police comms in your area
that you claim is taking place. One of your last statements was that an
"internal" investigation may not make it to public records, and I
agreed. However, an internal investigation implicitly focuses on one of
their own. I asked if you are maintaining that a police officer is doing
the cb interfering. You never replied or offered an explanation.

Sparky and tnom,

I believe you guys are BOTH right!

You are just looking at the same measurement issue from different viewpoints.

A good equipment designer has to look at BOTH the instantaneous peak power AND the RMS value of the peak of the modulation envelope (with or without a carrier).

The first case is for component breakdown issues dealing with instantaneous peak voltages and currents present during the instantaneous power peak.

The second case is for complying with FCC rules for transmitter power input to the final stage, and for calculating the power dissipation and hence the number of BTUs of cooling requirement that would be needed if that power level was sustained for any significant period of time.

The definition of RMS is really important in the second case.

The Root of the Mean of the Squares.

Theoretically it is the signal sampled an infinite number of times. Then squaring the values of each measurement because that turns the negative excursions into positive numbers (because we all know that there is no such thing as negative power). Then to get the average we add up all those infinite number of squared measurements and divide them by the infinite number of measurements we took, (that gives us the Mean, or average value, of all of the squares), and then take the square root of the result to dispose of the squaring we did in the first place in order to make all those negative numbers into positive ones.

That is only THEORETICALLY!

In real life, if we know all of the frequencies and amplitudes of the signals present, we can integrate them over a time equal to the period of the lowest frequency present and get the average power that way.

In real life, the best we can hope to get is a 'snapshot' of the peak event. or a number of 'snapshots' that are taken over a period of time equal to the period of the lowest frequency present that we can integrate to get the average power.

I like the Bird with the peak reading kit because if I use it with 2-tone modulation I can get a pretty good idea of the transmitters capabilities by looking at both the average and peak readings.

I do that with full knowledge of the fact that the more complex the modulated envelope, the more error there would be in the meter readings.

Just my 2 cents worth.....

I hate to see 2 intelligent guys arguing over semantics.....

Regards,

Dennis O.

I have known all along what you were equating. It exist but is not
what this thread is about. What you were equating is NOT what
peak reading wattmeters do. And that goes to the heart of what this
thread is all about. What is peak power as it relates to RF power and
peak RF wattmeters.

> You are just looking at the same measurement issue from different viewpoints.

Exactly, but I was hoping tnom could look that up for himself.

PEP was first measured at the input of the final, where it was more
convenient to measure it as P-P power at max modulation. Later, as the
power meters became more popular, they would read the 'average' at
peak modulation, and the term PEP changed. The FCC adopted this
because it is a value that is easier to measure.

If tnom had done just a little bit of research on the subject, as I
suggested, he would have discovered this. People need to start
learning things for themselves instead of relying on a newsgroup for
all their tech knowledge. All it takes is a trip to the library.

> A good equipment designer has to look at BOTH the instantaneous peak power AND
>the RMS value of the peak of the modulation envelope (with or without a
>carrier).

Absolutely, because you need to know what the absolute maximum values
that are coming out of the final. Since SSB has no theoretical limit
to power, the modulation needs a limiter, and that limit can only be
determined by p-p PEP.

Hi Twist,

I see you have inserted yourself into this thread.

You are confusing "internal affairs" with "internal investigation".
Perhaps you have been watching too many Hill Street Blues reruns. An
internal investigation can focus on most anything --- from pigeons are
shitting on the chief's car, to the janitor leaving the coffee pot
plugged in overnight -- and isn't necessarily limited to police or
emergency employees.

The point that Kieth brings up is a good one. Cases of RF interference
to police or emergency comms would likely never make it to the local
news media or even end up on the log.

Nice try though. You certainly can be creative when it comes to
getting keyclowns off the hook. Maybe you should hang up a shingle,
"Public Defender, RF Pirates a specialty".

Hi Keith. I wasn't going to bring it up, but the cat seems to have got
your tongue concerning your subject of an "internal" investigation
regarding cb interference to emergency and police comms in your area
that you claim is taking place. One of your last statements was that an
"internal" investigation may not make it to public records, and I
agreed. However, an internal investigation implicitly focuses on one of
their own. I asked if you are maintaining that a police officer is doing
the cb interfering. You never replied or offered an explanation.

--

Ok you want an explanation, you got it. No no officer is being investigated
for running illegal equipment, in fact one of the officers a friend of mine
once came to me in person long ago when I was one of those people running
power and a radio that spit out harmonics. He was an officer that liked to

hang out and BS with s on the local channel on slow nights he was patroling, he stopped by one evening and rather politely asked me and my freind to kill the power as we were knocking out their comms, he even had an audio tape of our conversation bleading their system. This happened 6 years ago, he never took it further and I stopped running power and sliced radios.

I found out late last week that one of the persons that has been responsible for the interuption of comms recently, has goten out of the hobby, due to some legal problems, not radio related, he owed a ton of back child support, and he was advised to make payments or sit in the cooler for an extended period of time, he sold everything to start catching up.

The only time information is required to be made public, is when it is filed in court, and even then the details do not have to be explicit. The police, or Sheriffs Department make the decision to release what they want, when they want to the press, many times the olny reason that information is listed in the first place is that the media hears the response to the complaint over a scanner, so they call the police and ask questions. It is up to the LEA (Law Enforcement Agency) to give them the info they are asking for.

And last, Twist, if you have any further disagreements, you have my email. There is no sense in polluting an already polluted discussion group with a disagreement between two people.

Keith "WebDoc" Hosman

P.S. SD SpecialDelivery Jones I am still waiting, you made a blast at me in public, I gave you the information that shows who I am with verification.

>peak RF wattmeters.

And because there are so many different possible interpretations, you need to be very specific when you want to get precise. Did you notice all the different uses of the term "Bird watt"? There is no standard for a "Bird watt", it is considered by different people to mean different things, and can mean PEP, peak, RMS or average. And until you know what's being read (AM, FM, SSB, DSB, A3A, a CB radio, a broadcast transmitter), and with what (Bird 43, Bird 43 modified for PEP, RF thermocouple, field strength meter, your tongue), how it's being read (dead key, voice modulation, two-tone modulation, over-modulated carrier), and by whom (N0BK, Joe Bigwatt, Pellets the Wonder Rabbit), nobody can be quite sure what the measured power really means.

But there is the case of commonly understood terms. PEP is commonly understood as the peak power of an SSB signal when read with an RMS (or averaging) meter. That's fits the FCC's definition just fine. An RMS wattmeter is used for AM because it will show a drop in power if and when the modulation is asymetric, such as what happens when the carrier is overmodulated, or when the power supply is insufficient. When you measure the power from a CB radio, it's generally understood that if it's AM it is read in terms of RMS. If it's SSB, that's the peak RMS power (or PEP, as defined by the FCC).

As I showed in another thread, "Bird watt" is not a commonly understood term.

If you take apart most of these "PEP" meters you will find that they are only an RMS meter with a sharp attack and slow decay, making them useful for measuring the peak RMS power of an SSB signal, but mostly worthless for AM except to show a power reading higher than carrier power.

So the point of this argument is that the FCC reads AM with carrier power, which is measured with an RMS meter; and SSB with PEP, which is measured with either an RMS meter or a peak-reading RMS meter (call it a PEP meter if it makes you feel better). But the concept of PEP was created to measure the absolute peak power of an SSB amplifier, and in that case it requires the full P-P values. If that's what you are

getting on your meter, then it is a true PEP meter.

And THAT is what this is about.

(BTW, a Bird 43 is an RMS meter.)

Sparky wrote:

> (BTW, a Bird 43 is an RMS meter.)

I believe the Bird 43 can be classified as an average reading meter that is calibrated in RMS values, and only reads correctly when there is symmetrical modulation of the signal being measured.

Overmodulation (clipping) usually causes it to read high values that are quite incorrect.

It is only accurate as a true peak reading meter if the peak lasts at least 200us and has a repetition rate at least 30 pulses per second. (These limitation specs are from the KIT)

A true sideband peak reader would have to be able take an accurate sample in a period of time shorter than the period of the highest frequency contained in the sideband and hold that reading for a rather long period of time if we were measuring the ssb output power generated as a result of normal speech input.

That would require a peak sample time of about 18NS at 27.5MHZ. (That's a sample period 10,000 times shorter than what the Bird can actually do)

And the HOLD time should be in the neighborhood of seconds if you are sampling speech generated sideband power. (That's about 60 to 90 times longer than what the Bird can do)

Their digital readout models work a little better but still read just as incorrectly on RMS if the waveform is complex.

I guess the best RMS meter would be a thermocouple meter, but they suffer from LAG time.

Regards,

Dennis O.

Looks like you have gotten some fairly balanced advice, something I
thought not possible in the NG lately. Good deal.

One thing you might think about is that running illegal power does
nothing for your receive capability. In other words, you may be able
to be heard 10 miles instead of 5, but what good is it when you can't
hear anyone more than 3 miles away? Unless you just like to hear
yourself talk, "mo power" does no good at all.

The other thing is examining why you might be interested in getting a
ham license. Most people who get into it have at least some technical
interest in radio and electronics and that motivates them to study the
code and the theory.

If you just want a way to pass time while driving, maybe books on tape
are the way to go.

If you look closely at the Bird Catalog, you will see that they explain how
there Pick up element "slug" works,and even the formula they
use to calculate watts.

> Overmodulation (clipping) usually causes it to read high values that are quite

So anyone who sells amps would want to have an over modulated,clipped and
peaked radio to show some bogus watts?

Didn't you post about a mod you did for the peak reading kit? If so what do you
do to it, and does it help with your readings.

Yes since it is the slug that is doing the calculations, the meter is just a 30
micro amp voltage meter.

From: voobner@yahoo.com (Aaron H. Voobner)
twistedhed@webtv.net (Twistedhed) wrote:
Hi Keith. I wasn't going to bring it up, but the cat seems to have got
your tongue concerning your subject of an "internal" investigation
regarding cb interference to emergency and police comms in your area
that you claim is taking place. One of your last statements was that an
"internal" investigation may not make it to public records, and I
agreed. However, an internal investigation implicitly focuses on one of
their own. I asked if you are maintaining that a police officer is doing
the cb interfering. You never replied or offered an explanation.
-
Hi Twist,
I see you have inserted yourself into this thread.
-
No, you did. Read it again.
-

You are confusing "internal affairs" with "internal investigation".
-
Not at all, you are. Go back and read my last post to Keith concerning
this matter. It distinguishes.
-
An internal investigation can focus on most anything
-
No it can't. It must be department related. There are exceptions to
this, but again, a judges order would exist.

--- from pigeons are shitting on the chief's car,

-
Only if the pigeons are owned by the department.
-
to the janitor leaving the coffee pot plugged in overnight -- and isn't
necessarily limited to police or emergency employees.

Then we have nothing else to talk about concerning this thread because
you just made it abundantly clear you do not understand what an internal
investigation fully entails.

The point that Kieth brings up is a good one. Cases of RF interference
to police or emergency comms would likely never make it to the local
news media
-
That's entirely up to the editor, not your pontification.
-
or even end up on the log.

-
I suggest you go back and reread my original post. It explains what you
do not understand concerning a judges order with the media.
Now, if it is acceptable to you, I wish to hear Keith's reply.

So that being said,that could be a reason some of these guys see bigger numbers
than what is really happening at keydowns?

You offered a mod for the peak reader a few diodes were changed? or something,
does it improve am or ssb readings.

>
> Their digital readout models work a little better but still read just as
> incorrectly on RMS if the waveform is complex.

Yes, because they use the same slug to measure the output like the Bird 43,
the meter is just reading what the slug tells it to read a simple 30ua
voltmeter

Source record: 112228

Ok you want an explanation, you got it. No no officer is being investigated for running illegal equipment, in fact one of the officers a friend of mine once came to me in person long ago when I was one of those people running power and a radio that spit out harmonics. He was an officer that liked to hang out and BS with s on the local channel on slow nights he was patroling, he stopped by one evening and rather politely asked me and my freind to kill the power as we were knocking out their comms, he even had an audio tape of our conversation bleading their system. This happened 6 years ago, he never took it further and I stopped running power and sliced radios.
I found out late last week that one of the persons that has been responsible for the interuption of comms recently, has goten out of the hobby, due to some legal problems, not radio related, he owed a ton of back child support, and he was advised to make payments or sit in the cooler for an extended period of time, he sold everything to start catching up.
The only time information is required to be made public, is when it is filed in court, and even then the details do not have to be explicit.

-
Not true. All 911 calls, complaints, etc., are public domain under the freedom of information act. There exist exceptions to this, like in cases of domestic violence, but for the most part, how the heck do you think that the newspaper can print: (Example) "Henry County reported 43 asaults last month, 12 noise complaints, 27 domestic calls, etc. etc. The list goes on and on.
-
The police, or Sheriffs Department make the decision to release what they want, when they want to the press, many times the olny reason that information is listed in the first place is that the media hears the response to the complaint over a scanner, so they call the police and ask questions. It is up to the LEA (Law Enforcement Agency) to give them the info they are asking for.
-
It certainly is, unless they want sued. Media comb the police blotter each shift, Keith, which is why the PD's and sheriff's have appointed media spokespersons. A working relationship exists between most mainstream media and working PD's, so much that the reporters on that specific beat locale or jurisdiction is usually on a friendly and first name basis with the pd's spokespersons. In many cases, the pd's call the media.
-
And last, Twist, if you have any further disagreements, you have my email.

-
I questioned something you posted, Keith. It was an honest question with no malice in response to claims being made concerning cb interference which has not been substantiated, Then again, most of the claims concerning cb interference among these pages haven't.
-
There is no sense in polluting an already polluted discussion group with a disagreement between two people.
-
Sorry you feel that way, Keith. It wasn't a disagreement until you ignored me and chided someone else because you felt they were avoiding answering you. I felt the same but let it go until that remark. I felt I was owed a reply, just like you. Since you had no bones about posting that information here I didn't see a problem asking about details.

One can HOPE so. I wouldn't be surprised considering some of the things I,
too, have been
hearing, if this IS so. I know for a fact that ARRL, FCC and the ITO have
been studying this
issue for some time now. Now I don't purport to have "inside" info, but I
had heard certain
ideas being kicked around. It IS possible to make radios extremely
difficult to "open up" or
modify for "extra channels" as per the HTX10 that was being hotly discussed
last year on the
CB newsgroups and websites as to whether it could be modded. The last I
heard was that it
does not lend itself well to modifications to work outside its intended
band. The ones I heard
about "freaked" when they were attacked with the golden screwdriver and
Radio Shack report-
ed a number of "mysterious" returns where, upon checking out the radios,
nothing wrong was
found <<snicker>>.

Without trying to get junk started, one of the things I have expressed here
is that there ARE
things in the pipeline to deal with the rash of illegal "freebanding" and
incursions onto the l0 meter band. It will move slowly (government always
does), but the issue is under scrutiny at
this time. While I don't have so-called concrete and "inside" info, I am
certain, because of what
I HAVE heard, that this is not a surprising result of the unlawful activity
that has been going on for a long time.

Of course you inserted yourself into this thread. It was between WebDoc and SDJones. But you sensed illegal CB was getting some bad PR, so you came in to do some needed damage control.

>Then we have nothing else to talk about concerning this thread
>because you just made it abundantly clear you do not understand
>what an internal investigation fully entails.

Twist: you know nothing about the internal workings of police and emergency departments. Oh, you can rant and rave how you "know people" or you have "seen" this or that, but you can't prove diddly, because the truth is you are just an anonymous guy hiding behind a phoney name who is afraid of exposure.

"Twistedhed" says CBs don't interfere with emergency comms?

Sure, and "Boo Boo Bear" says he is King Of The Moon.

Both of them have proof, too!

I am looking for schematics, or kit information, to upgrade old 23 channel CBs to 40 channel. Specifically, I need info for the Pearce-Simson Super Lynx, and the old Cobra 29A.

They used to make legal mods for them; where are they now?

Thanks.

Twistedhed wrote in message
<11108-3C43810F-170@storefull-123.iap.bryant.webtv.net>...

Not true. All 911 calls, complaints, etc., are public domain under the freedom of information act. There exist exceptions to this, like in cases of domestic violence, but for the most part, how the heck do you think that the newspaper can print: (Example) "Henry County reported 43 asaults last month, 12 noise complaints, 27 domestic calls, etc. etc. The list goes on and on.
-

<insert my comments>

Yes you are correct, if it is a complint made by a citizen, but if the complaint is filed internally, as these were, then there is no 911 record, and nothing that needs to be released.

<end of this comment>

The police, or Sheriffs Department make the decision to release what they want, when they want to the press, many times the olny reason that information is listed in the first place is that the media hears the response to the complaint over a scanner, so they call the police and ask questions. It is up to the LEA (Law Enforcement Agency) to give them the info they are asking for.
-
It certainly is, unless they want sued. Media comb the police blotter each shift, Keith, which is why the PD's and sheriff's have appointed media spokespersons. A working relationship exists between most mainstream media and working PD's, so much that the reporters on that specific beat locale or jurisdiction is usually on a friendly and first name basis with the pd's spokespersons. In many cases, the pd's call the media.
-

<Insert my comment here>

The media can sue all they want, they can even try to sue the military for not telling them their plans overseas, or regarding the transfer of the prisoners to gitmo. But the media has to realise, that just because they want to know, doesn't give them the right to know all. Some things need to remain ubtold until the story is complete. In the example of the terrorist assholes, they too watch CNN, look at what happened in desert storm, hell they shows the Navy Seals landing live on television, they looked pissed too, I know my cousin Troy was. Likewise the police do not have to go around announcing with a bullhorn 2 days before they do a drug raid, that would

really defeat their purpose eh?

<end of coment>

And last, Twist, if you have any further disagreements, you have my
email.
-
I questioned something you posted, Keith. It was an honest question with
no malice in response to claims being made concerning cb interference
which has not been substantiated, Then again, most of the claims
concerning cb interference among these pages haven't.

-

<insert comment>

You and I had already had this discussion in private, and I had shared my
experiance with Wolfman, the officer who came knocking on my door regarding
my running power. Let me put it to you this way, I live right on US 6, at
the intersection of OH 65, there is alot of truck traffic running through
here. And while I highly respect the truck drivers, as w/o them none of us
would have the luxuries we have in our homes, as the rail lines do not run
from the factory to your local walmart, or from the field to your local
grocery store. These truck drivers on a daily basis are coming through my
systems here, my scanner which is VHF/UHF, and my Kenwood TK-340D which has
the SO, FD, Rescue, and police freqs in it. Now there is absolutely no
reason they should be coming through these systems, and don't give me crap
about front end overload, poor filtering, and POS equipment.

<end of coment>

There is no sense in polluting an already polluted discussion group with
a disagreement between two people.
-
Sorry you feel that way, Keith. It wasn't a disagreement until you
ignored me and chided someone else because you felt they were avoiding
answering you. I felt the same but let it go until that remark. I felt I
was owed a reply, just like you. Since you had no bones about posting
that information here I didn't see a problem asking about details.

<insert comment>
I wasn't ignoring you, as many threads as there are it is easy to get lost.
Also I have been a tad bit busy lately eh? Updating local chapter disaster
plan, renewing shelter facility agreements within the county, paperwork up
the wazoo, classes both teaching and taking.
<end coment>

Aaron, whilst I disagree with some of your tactics, you have made an excellent point about the receive range vs transmit range. A few high power stations may well work each other, but in doing so can harm communications for many modest or even legal stations. They cannot hear the vast majority of stations that they can reach. If you can't hear 'em, ya can't work 'em. Why the fascination about 10 (or 11 or 12) meters? That tech license, used through repeaters, will likely net one more local range than those 100 or 1000 watt 27 or 30 MHz stations - simply because repeaters are located HIGH. We aren't talking skip here, we are talking 24/7 communications. I am not taking sides either. So what if you can be heard 70 miles away? You won't hear anything from 70 miles away unless they too are running quite a lot of power. Frankly, my 6 aa alkalines on 440 give me well over a 60 mile range to a mobile through various repeaters. Rochester South to Pennsylvania, East to Watertown, and West past Buffalo does qualify as over a 60 mile range. This is without skip and without internet linking. Yes, I've been asked about the range without the repeaters. Problem is, the repeaters are there. I can work a dozen different repeaters on my HT sitting in my living room. Works very well into Australia also, courtesy of the 10 meter port.

73 from Rochester, NY

Despite that, they give the best indication of RF current, and when
used in combination with an RF voltmeter, will give one of the most
accurate measures of power possible. That's one way we do it at the
stations.

You pop up and start with this garbage that says basically nothing
except that you don't like me. waah. Then you make a pathetic attempt
to prove me wrong. When that leads to confusion you just keep begging
me for proof, which was available to you all the time; and telling me
how wrong I am, as if there is truth in repitition.

And you still haven't pointed out my misinformation. I led you on,
true, until Dennis let you off the hook. But you could have done that
yourself if you weren't so lazy and read a book once in a while. The
only information you provided came off the internet; while that may be
a good source of info, it is also a bad one, and unless you verify
your info you are just going to get lost.

Next time you want to argue facts, come prepared. But I have to give
you credit tho, when finally faced with the facts you didn't run away
like Toll did.

Not where I was taught.

I'm sure your psychic abilities allow you to go back through my education as
well, though.. So we can leave it at that.

OK, but so far you have repeated what I spoke of.

So what did that prove.. Again, that you only want to argue semantics, not
debate a topic.

Please explain to me what happens when you begin to disspate in the grid of
the 4CX1000 then.

Last few tubes I saw that had grid current on them fried. As will Eimac
concur.

If you have a tube designed for no grid current, and chose to operate it in
AB2, then you will
have distortion as well.

Tubes designed for AB1 operation shouldn't pull grid current... And you
inferring that a tube
that has a 0watt grid should be operated AB2 is ludicrous.

> you cite any other wattmeters you might use?

Because within the people that I deal with in the CB community, we don't use
other meters.

If they do, on the off chance, its a coaxial dynamics... Interchangable
with the Bird.

Other people that use other meters (Bill Eitner), cites his Autek when he
uses it, and his Bird when he uses it.

So you see, this entire thread was pointless.

Or any other measurement
> tools you use? Does your battery put out Fluke volts?

Nope. but if their where as many differences in voltage meters commonly available over the counter, I would.

Are your
> frequencies measured in Schulmberger MHz? Do you even see what I am
> getting at here, Toll?

Yup. However the quality of most measurement devices that CBers have / use is so close to each other when it comes to readout / resolution / accuracy, it doesn't matter what we use, they are all within a tolerance that makes it easy to handle.

A Dosy wattmeter, taken out of the box, was found to be so innacurate as compared to a Bird, that the AVG power indicated on the Dosy where almost identical to the Bird in PEP mode.

However, I have some GC electronics stuff that has stood the test of time that is really close. My Heathkit WM-102 is close on some scales, not so close on others.

See the problem. Most all of us have a digital voltmeter, and they all pretty much read within a 10th of a volt. Same with our frequency counters. Same with ..... Ad infinitum, sans the wattmeter, because who KNOWS who has been in it, was it dropped, etc.

Since the Bird withstands abuse better, is usually more accurate than ANY CB type wattmeter, and handles the power, it has become the standard as to which others are compared. If we had the same problems with other measuring equipment, we would qualify that as well.

And I use Fluke for B+, Tek for scopes and I prefer HP for my counters.

No, I don't use the term rms when dealing with wattage. Not on rec.radio.cb

Look for the thread about it approximately 2 years ago... You will see why.

I don't intend to hash it up again.

Bill,

Some companies did offer retrofit kits back when they went to 40
channels.... They where the Cybernet 02A 23 channel chassis.

The conversion consisted of a new channel selector, and instructions on how
to broadband the rx and tx chain.

A licensed technician (yes, at one time you had to be licensed to work on
this stuff) was required to certify (basically, put his name on the line
that it was within spec) the radio (a receipt for labor and a tamper
evidence seal) was usually enough.

Actually quite a few majors where sold in the states.

Generally (not to knock your equip) they where considered low end export stuff. Made by the Cybernet company. Midland, Colt, Hy-Gain, and a few others rebranded their chassis and sold under their own name.

They where OK, but in comparison to what is available today, most shy away from them.

Hi folks/
Just curious to what one of these rigs would go for.(used)
Has AM/SSB, tuning knobs.
Unit works very well, and in good shape, but not sure if I want to pay alot for it.
I would like to hear your opinions of this unit.
It is a tube type.
Thanks in advance....
Please email me direct...

> of stations that they can reach.

True. I guess my point is for a trucker who wants to actually
communicate with other stations the high power thing doesn't even
make sense. It's only appeal is to folks who want to blank out a
channel or engage in RF dueling.

It really is too bad that there is not a portion of VHF spectrum set
aside for the exclusive use of truckers. It's obvious that they
desperately seek some quiet patch of spectrum away from all the "Toll
Free's" and "Train's" who have made their band useless.

>with the Bird.

Well, that just contradicted your previous statement.

>Other people that use other meters (Bill Eitner), cites his Autek when he
>uses it, and his Bird when he uses it.

And you just contradicted both previous lines.

>So you see, this entire thread was pointless.

I don't agree. Anybody that reads these threads are going to see how many times I disproved your BS. They will also see how you spin when someone holds the facts up to your face. Maybe you have convinced others that you know what you are talking about, but the -facts- will always be in the archives for anyone to read if and when they should ever want to check up on your RF know-how. At the very least, there will be quite a few educated and experienced -professionals- that will get some good laughs when they read your posts. So it's not all for naught, Toll. You really are good for something.

If I am, you haven't disproven anything yet. Actually, I am wrong on a
couple points, but you totally missed them.

> others you might have been right on, but due to your sematics
>chasing, nothing was made clear.

You keep crying about semantics and psychic abilities. Is there some cosmic rule I missed -- something about 'truth by repitition'? That seems to be a common trend around here.

I still don't understand why you keep whining about semantics. RF design is an applied science that requires a certain degree of uniformity in practice, procedure and vocabulary. That's required so that everyone can function on the same level. Don't keyclowns have their generally-accepted terminology? Oh, that's right, they have "Bird watts", and "PM FM", and "pills". Well, in the rest of the RF community (and that's the vast majority), that shit don't wash. And neither do you if you think you can ever try and pull your shit over the eyes of someone that knows better.

>Have a nice day

You too.

The term 'RMS watts' is inappropriate because the term 'watts'
necessarily implies RMS. The reason I use it is to identify the 'real'
RMS power from other kinds of power measurements, such as 'average',
'peak', PEP, and 'Bird watts'.

>

When 40 channel radio became legal (Jan 1st 1977), the requirements for type acceptance changed. Most non-PLL 23 channel radios did not meet these stricter type acceptance requirements, so there were no "legal" mods that could be retrofitted to a 23 channel radio, to bring it up to 40 channel status.

There were some early Cybernet PLL radios that were originally assembled as 23 channel radios, that were quickly pulled from the assembly line, refitted with a 40 channel selector, retuned, and sold. But once the new rules were in place it became illegal to sell a 23 channel radio as new.

Legality issues aside, there were a few companies that offered crystal upgrade kits for older crystal 23 channel radios. But I haven't seen those for a long time (the better part of 15 or so years). You can still order crystals from JAN or International crystal companies, and add in your own switches. But the cost of crystals has increased over the years, and the cost to upgrade a radio, such as a Cobra 29, would be more than the radio is worth.

Not entirely true. While there were kits available for the old Cybernet radios, once the radio left the factory as a 23 channel radio, it was no longer legal for them to be "modified" to 40 channel status. There were some of the old 3 crystal PLL boards that were factory modified with a 40 channel switch, and sold, but once the 40's became legal, you could not upgrade a 23 to 40 legally, and you could not sell a NEW 23 channel radio. Which is why there were HUGE discounts on 23 channel radios just prior and shortly after the 40's became legal. I can remember friends of mine running out to Lafayette radio to buy a Telsat SSB 50a, which originally sold for something like $279, which was then discounted to something like $59.95. A great price for a good radio, even if it was only 23 channels.

There were many upgrade kits available, but they weren't "legal".

For a while there was a bumper crop of surplus 3 crystal Cybernet chassis available through many parts outfits (This sparked many '73 magazine articles on building 6 and 10 meter FM radios from CB's). The simple reason for this was that they could no longer use them after a certain cutoff date, and they had a large inventory.

It is true that the 11 meter band can be "locked out" (But why was it included in the first place?).

What you have to consider is who is making these radios, and where are they getting their most sales. Uniden, RCI, et al, make "10 meter" radios, that really isn't all that desirable for hams. The Uniden 2510, became one of the best sellers, not because it was a great ham rig, but because it was an easy to convert, CB/Freeband rig. If Uniden were truly interested in the 10 meter ham market only, the microprocessor would never have had the 11 meter code in it (Heck it took more development work to add it in!). But they knew where their sales numbers were coming from, and hoped that the problem of legality would not be high enough on the FCC's radar to force any more drastic regulations on the manufacturers.

With this in mind, anything that the FCC does to the technical requirements of radios sold in the US, will not affect "export" radios made for other markets, that still manage (as contraband) to find their way into the US market. The government has thusfar not been all that successful at keeping these export radio out of the truckstops. They can't even stop the flow of drugs.
The manufacturers could also make a perfectly legal 10 meter radio, and through licensing arrangements with a 3rd party, offer an "upgraded"

microprocessor that contains the 11 meter code. Much like a "chipswitch", you can then still modify the radio although not as easily as the current models.

Much like guns, there are so many CB radios in use right now, that even an entire ban of the whole service would not clear the airwaves, legal or otherwise.

jason the galaxy line of radios is fine. yes they drift a little for the first minute or so as they warm up,but once warm they work great. rci 2950/2970 is also a good low cost free band rig. ham rigs also make good sideband freeband radios,but they have really crappy am modulation,as the emphasis is mostly on side band. so if your gonna shoot alot of am skip,stay away from ham rigs,ie icom ,yaesu etc. ive known people who worked the hell out of some ham rigs and couldnt get any good am modulation out of them.just the nature of the beasts i guess. there is a relatively new line of radios out there that are reasonably priced,have great modulation,and all the extras. this is the "magnum" line of radios. i suggest going to coppers web site they have great pix/descriptions of the rigs youll want to see....stay away from eei,they have a great web site,but youll get burned beyond belief if you deal with them. also, dont get taken by these nit wits offering to turbo-tune your new radio,or "peak it out" youll get a bastardized radio that is over-driven/over modulated. the radios are "perfect" as designed from the factory,but there is always some nut job who will tell you that he can make your new radio "better than new" trust me....leave it stock,there is no such thing as "better than the factory". trust me,ive been in free band for 15 years. get a good, new radio,and dont let any fool put his hands in it and start "twisting and turning".....just my advice. elpasogunslinger

I would shy away from it too if other, more modern equipment was more readily available here. It simply isn't. Even second-hand kit in shabby physical condition and doubtful operational condition (golden screwdriver suspected) is scarce and expensive.

However, for my needs (I only need AM for short-range local use) this old little thing will do just fine. I just need to undo some tampering by the previous owner - getting the crystal frequencies is the start of that process and a circuit diagram would help wonders. The more info, the merrier.

Sean.

Aaron, whilst I disagree with some of your tactics, you have made an excellent point about the receive range vs transmit range. A few high power stations may well work each other, but in doing so can harm communications for many modest or even legal stations. They cannot hear the vast majority of stations that they can reach. If you can't hear 'em, ya can't work 'em. Why the fascination about 10 (or 11 or 12) meters? That tech license, used through repeaters, will likely net one more local range than those 100 or 1000 watt 27 or 30 MHz stations - simply because repeaters are located HIGH. We aren't talking skip here, we are talking 24/7 communications. I am not taking sides either. So what if you can be heard 70 miles away? You won't hear anything from 70 miles away unless they too are running quite a lot of power. Frankly, my 6 aa alkalines on 440 give me well over a 60 mile range to a mobile through various repeaters. Rochester South to Pennsylvania, East to Watertown, and West past Buffalo does qualify as over a 60 mile range. This is without skip and without internet linking. Yes, I've been asked about the range without the repeaters. Problem is, the repeaters are there. I can work a dozen different repeaters on my HT sitting in my living room. Works very well into Australia also, courtesy of the 10 meter port.
73 from Rochester, NY
Jim
-
What is the 11 meter fascination? Ironically, some of the same reasons you speak of when referring to the tech license are exactly why it is of no interest. A repeater just doesn't do it for many of us. 24/7 long distance hassle-free communications? Nah, but I understand how many can prefer it. The challenge is better on 11 meter and the crowds much more enthusiastic and friendly (on the freeband, that is)
I humbly submit that an autopatch is the best thing to come from ham radio yet and is great when calling home. I also am amused at how many call signs are shared.
PSK whaa? No thanks.
It's not all just a DISTANCE factor concerning 11 meter..if it was, I believe many of us would be on 2 meter using the repeaters that retransmit for you. It's the thrill of doing it on our own, especially barefoot, with no assistance except mother nature when she has her skirt hiked way up high.

Aaron, actually there ARE places set aside. Problem is you need a license (not amateur). Truckers can also be found in low band VHF (just above 30 MHz), high band VHF, and UHF. These also allow the use of repeaters. They are, of course, commercial repeaters for commercial users and cost on the order of seven bucks per month per radio per repeater. Many of these repeaters offer extensive coverage - the low band repeaters often cover more than one state. The other thing worth mentioning is that you don't pick up these radios for $80.00 at Radio Shack. I have no idea what the future holds for these since cell phones have gotten so cheap with air time - I remember installing over FIFTY radios for one company - and they wanted the use of three different repeaters for each truck so they could cover most of New York State. Ummmm fifty times six bucks per repeater is 300 - um times three repeaters. The repeater owner was making some serious money every month (which is why he sold the radios at cost). Of course six bucks times three repeaters still won't pay for a cell phone, but if cell phones get much cheaper or the freight gets much higher on the repeaters (or you need even more repeaters) ... one can see a possible transition point in the future. I might add that the low band VHF has largely been abandoned in favor of high band VHF and UHF. Seems they don't care for interference from skip.

1997. Re: taking off for the weekend

Newsgroup: rec.radio.cb
Date: 2002-01-15 15:18:34 UTC
From: twistedhed@webtv.net
Message-ID: <19626-3C44484A-415@storefull-127.iap.bryant.webtv.net>
Source record: 112286

NNTP-Posting-Date: Mon, Jan 14, 2002, 10:29pm
Twistedhed wrote in message
<11108-3C43810F-170@storefull-123.iap.bryant.webtv.net>... Not true. All 911 calls, complaints, etc., are public domain under the freedom of information act. There exist exceptions to this, like in cases of domestic violence, but for the most part, how the heck do you think that the newspaper can print: (Example) "Henry County reported 43 asaults last month, 12 noise complaints, 27 domestic calls, etc. etc. The list goes on and on.
-
<insert my comments>
Yes you are correct, if it is a complint made by a citizen, but if the complaint is filed internally, as these were, then there is no 911 record, and nothing that needs to be released. <end of this comment>
-
Correct. At the time of an ongoing internal investigation, details can be kept from the public.
-
The police, or Sheriffs Department make the decision to release what they want, when they want to the press, many times the olny reason that information is listed in the first place is that the media hears the response to the complaint over a scanner, so they call the police and ask questions. It is up to the LEA (Law Enforcement Agency) to give them the info they are asking for.
-
It certainly is, unless they want sued. Media comb the police blotter each shift, Keith, which is why the PD's and sheriff's have appointed media spokespersons. A working relationship exists between most mainstream media and working PD's, so much that the reporters on that specific beat locale or jurisdiction is usually on a friendly and first name basis with the pd's spokespersons. In many cases, the pd's call the media.
-
<Insert my comment here>
The media can sue all they want, they can even try to sue the military for not telling them their plans overseas, or regarding the transfer of the prisoners to gitmo. But the media has to realise, that just because they want to know, doesn't give them the right to know all. Some things need to remain ubtold until the story is complete.
-
Yup, agreed, especially in a case of domestic violence or when it may endanger a potential witness, or as you alluded above, in instances of national security.
-

In the example of the terrorist assholes, they too watch CNN, look at what happened in desert storm, hell they shows the Navy Seals landing live on television, they looked pissed too, I know my cousin Troy was. Likewise the police do not have to go around announcing with a bullhorn 2 days before they do a drug raid, that would really defeat their purpose eh?
<end of coment>
-
No comparison to cb interference.
-
And last, Twist, if you have any further disagreements, you have my email.
-
I questioned something you posted, Keith. It was an honest question with no malice in response to claims being made concerning cb interference which has not been substantiated, Then again, most of the claims concerning cb interference among these pages haven't.
-
<insert comment>
You and I had already had this discussion in private, and I had shared my experiance with Wolfman, the officer who came knocking on my door regarding my running power. Let me put it to you this way, I live right on US 6, at the intersection of OH 65, there is alot of truck traffic running through here. And while I highly respect the truck drivers, as w/o them none of us would have the luxuries we have in our homes, as the rail lines do not run from the factory to your local walmart, or from the field to your local grocery store. These truck drivers on a daily basis are coming through my systems here, my scanner which is VHF/UHF, and my Kenwood TK-340D which has the SO, FD, Rescue, and police freqs in it. Now there is absolutely no reason they should be coming through these systems, and don't give me crap about front end overload, poor filtering, and POS equipment.
<end of coment>
-
No, I won't mention your devices, since we indeed touched on that before. I don't doubt at times truck drivers may cause some splash. Not once have I ever questioned that.
Yes, you and I talked of the police coming to your door concerning bleed.
-
There is no sense in polluting an already polluted discussion group with a disagreement between two people.
-
Sorry you feel that way, Keith. It wasn't a disagreement until you ignored me and chided someone else because you felt they were avoiding answering you. I felt the same but let it go until that remark. I felt I was owed a reply, just like you. Since you had no bones about posting that information here I didn't see a problem asking about details.
<insert comment>
-

I wasn't ignoring you, as many threads as there are it is easy to get lost. Also I have been a tad bit busy lately eh? Updating local chapter disaster plan, renewing shelter facility agreements within the county, paperwork up the wazoo, classes both teaching and taking. <end coment>
Keith "WebDoc" Hosman
-
Not a problem.
Concerning present day interference to emergency comms., I will say this,..of all the claims among these pages concerning cb interference to police communications, not one has been able to be confirmed in the last 2 years. I'm not saying it NEVER happened, as I have read about cases where weird things occur, ..just reiterating what I have always maintained..most can't be confirmed for this reason or that reason, plenty of it is hype, the rest is BS. This is not directed specifically at you Keith, so don't take it as such, but for all the interference claims made here to emergency comms by cbers over the last several years, do you not find it just a tad odd that NONE can be positively confirmed or identified?

From: joshjonarael@aol.com
Message-ID: <20020115102819.02595.00000930@mb-fb.aol.com>
Source record: 112284

I would like to know what is a good cb radio to buy. Something that can receive and transmit up to 5 miles clearly. Currenty I have 2 cheap radio shack cb radios that can pickup conversations between 1/2 mile to a mile. Do I need an export, or can I buy something like a cobra, then put some power into it? This will be going into my pickup truck.

Brewer Labs never used 8950s that I know of, and I posess a complete
schematic set for his amps.

the guy should pay you to take it
> off his hands.

Why? If its a working amplifier, and run correctly (within spec), it would
last a good long time.

its not worth much. if the tubes are bad you might as well use it
> for a door stop.

Well, unless you find someone who can retube it.

Although I don't like Varmint amps. Had to replace way too many of their
underdesigned transformers.

Just my .02 worth. I'd pass on one for sale. If offering one, between 50
and 150, depending on tube condition, amp condition, cosmetics, etc.

www.cbcintl.com should have what you need.

They sell a complete service manual for the older cybernet export equipment.

If you don't want to do business with them, www.rfparts.com also resells the manuals.

I believe its the Cybernet Export manual. Someone with one handy can verify if it has
your particular radio in it.

Get ahold of Bill Eitner.

He will give you the Pro's and Con's of the Pirate brand, and can even get you one if you want.

Bottom line (I haven't seen one of steve's amps in over a year, so consider the age)...

They are decent amps.

They get remarked into a LOT of other amps (he sells blank faced, as well).

I'm assuming that you have a radio shack antenna.

Pick up a Wilson. Your range should go WAY up.

Otherwise, let us know about your installation. Any radio should be able to pick up a lot farther.

Of course, if your trying to talk in the middle of the afternoon, the skip can make that darn near impossible.

I have a Maycom AH 27...

I have a twig in the loft.

Would I get more for my 4 watts if I used it from the mains as apposed to
batteries ???

HAHAHAHA!!!! You are funny, tnom! You exposed yourself! Let's see now, what have you proven:

1. That you didn't know that PEP is a method that was originally developed to measure SSB power;

2. That you didn't know PEP can be measured in P-P, RMS and AVG;

3. That you didn't know PEP can be measured on the DC input of a final AS WELL AS with a meter on the output;

4. That you didn't know other people are capable of a more complete understanding of the subject than Toll or yourself.

>I have done my job. I have corrected your misinformation. I HAVE
>exposed you.

You can keep saying whatever you want as often as you want, and maybe, if you wish real hard, it will come true.

On the other hand, I would much rather tell people to go look this stuff up for themselves at their local public library, so then they will have a good understanding of the topic of interest and won't get conned by attention-seekers armed with incomplete facts and half-informed opinions. That's MY job, tnom, and I do it well.

I have no argument with what you say. Of course, these radios were not targeted towards hams. *Most* hams buy multi-band HF rigs because it doesn't make sense to buy a single band radio only to upgrade later as one upgrades his ticket. There are, of course, exceptions.
The fact that the mfrs. went to the trouble to add other codes is questionable. I would think, rather, that the radios' basic designs were somewhat broadbanded in order to sell them in dif-ferent markets under different rules. This would represent a cost savings rather than an expense, wouldn't you think? They also took advantage pf the now discredited premise that people would use them as intended. If not, then they might be able to shrug and say, "How could we know the customer would do that"--putting on the sad face in public and smirking in private. They know EXACTLY what they are doing.

As far as "sunsetting" 11 meter CB, never say "Never". They wouldn't have to bust everybody-just enough high profile sellers and users for the word to get around. IOW, make the risk of being the one caught too high for comfort.

It's the thrill of being illegal, you mean. Instead of looting part of
the spectrum and imitating ham radio with your 'divisions',
'activations', DX awards, and screwed up Q-signals, why don't you guys
do it legally and obtain legitimate amateur HF privileges?

True, but I think Aaron (whoever he may be) was talking about truckers; which is not to say they only want communications to a base, but if they do, business band is the way to go. As far as a tech license, certainly, when 10 meters is open, the 10 meter port here is quite active. I use it through a 440 port and have talked to Australia. Europe and other points come in frequently. I think the point was concerning high power and how you can be left with many channels of interference - although, again, if skip is in, you don't necessarily need a high power station to cause interference. Barefoot can certainly be fun. I used to talk to VK2NP for hours on end using teletype (although signals barefoot were far above those necessary for phone communication). Myself, I have stated (and this is SURE to cause flames) that I can understand the modest afterburner. I have also stated that I cannot understand the several hundred watts plus stations on CB. It does cause problems. I try not to worry about it too much; certainly if there are enough problems the people being jammed will cause enough stink. This newsgroup doesn't deserve a bunch of people being here with no other purpose than to cause grief.

From: j.r.hampton@worldnet.att.net (JAMES HAMPTON)
Aaron, whilst I disagree with some of your tactics, you have made an excellent point about the receive range vs transmit range. A few high power stations may well work each other, but in doing so can harm communications for many modest or even legal stations. They cannot hear the vast majority of stations that they can reach. If you can't hear 'em, ya can't work 'em. Why the fascination about 10 (or 11 or 12) meters? That tech license, used through repeaters, will likely net one more local range than those 100 or 1000 watt 27 or 30 MHz stations - simply because repeaters are located HIGH. We aren't talking skip here, we are talking 24/7 communications. I am not taking sides either. So what if you can be heard 70 miles away? You won't hear anything from 70 miles away unless they too are running quite a lot of power. Frankly, my 6 aa alkalines on 440 give me well over a 60 mile range to a mobile through various repeaters. Rochester South to Pennsylvania, East to Watertown, and West past Buffalo does qualify as over a 60 mile range. This is without skip and without internet linking. Yes, I've been asked about the range without the repeaters. Problem is, the repeaters are there. I can work a dozen different repeaters on my HT sitting in my living room. Works very well into Australia also, courtesy of the 10 meter port.
73 from Rochester, NY

Jim
-
What is the 11 meter fascination? Ironically, some of the same reasons you speak of when referring to the tech license are exactly why it is of no interest. A repeater just doesn't do it for many of us. 24/7 long distance hassle-free communications? Nah, but I understand how many can prefer it. The challenge is better on 11 meter and the crowds much more enthusiastic and friendly (on the freeband, that is)
I humbly submit that an autopatch is the best thing to come from ham radio yet and is great when calling home. I also am amused at how many call signs are shared.
PSK whaa? No thanks.
It's not all just a DISTANCE factor concerning 11 meter..if it was, I believe many of us would be on 2 meter using the repeaters that retransmit for you. It's the thrill of doing it on our own, especially barefoot, with no assistance except mother nature when she has her skirt hiked way up high.

Landshark,

Honestly, I don't have surefire "inside" info. But I do have contacts within ARRL, for example, who do know some of the things being kicked around. There's nothing set in stone yet, just ideas as how to get the illegals out of 10 meters. And I did read in an editorial in a ham mag. about pushing for tighter "curtains" in the single banded units like Ranger, etc. to make 11 meters impossible. There would still be "bootleg" rigs sold in truckstops. I also had an email from RH strongly suggesting that there was a major domestic supplier of such radios on the list to be hit (somewhere in Kentucky? Hehe!).

I am certain from the info I have gleaned that the 10 meter thing is something of a cockleburr in both the hams' and FCC's respective saddles, and that there are initiatives and discussions under way to stop it.

You know, if the folks that have strayed outside the 40 channels hadn't done that, hadn't ven-tured where they were sure to get noticed, I would venture a guess that a fella could run 100 watts or so, keep his station clean, operate his station in a courteous way and never be noticed. Because of the proliferation of 11 meter amps, the law was passed about any amp capable of 24-30 mhz right out of the box was illegal to manufacture or sell. It made it a minor inconven-ience to hams, but an inconvenience just the same. Of course, it had no affect on the number of amps in CB service. But the straying onto frequencies not authorized for CB is what is getting noticed--especially since the truckers decided that 10 meters was fair game. IMHO, THAT is what's going to cause trouble. If it weren't addressed now, where do you think the NEXT area of "conquest" would be?

>1. That you didn't know that PEP is a method that was originally
>developed to measure SSB power;

Tell me. How is it that you think you know what I know? Do you have special powers? You know nothing about me.

I know all I have to know concerning PEP. If this wasn't so then how can you explain myself plugging in numbers to the standard RF PEP formula and showing the results? Correct results. (carrier average and PEP, and 100% mod PEP)

Did you ever use your formula and then plug in the numbers to validate it? The answer is no. The reason is that your formula does not work so you couldn't possibly plug in the numbers. It would expose you as a fraud.

>2. That you didn't know PEP can be measured in P-P, RMS and AVG;

You still don't get it. RMS power IS the average power. P-P is your term. It has no use with standard RF power measurements. PEP as in peak envelope power is easily the most common term used to express peak RF power.

>3. That you didn't know PEP can be measured on the DC input of a final
>AS WELL AS with a meter on the output;

This subject never came up in any of my responses. Making thing up are you?

If a bird includes all of that...splatter,etc.
Why do they show less power? "Dosy" meters are the ones that swing all over the place and don't give you an accurate reading. At Stennis Space Center they use Bird wattmeters for their measurements.

2033. perhaps off topic...

I have been unable to reach "glenn 1616" on the 2 way here at home. he usually uses 36L or 38L & channel 2 on the others. i've tried the "others" on my 2 way but no luck.
he's in oregon's willamette valley as am i. if you can hear him (usually mornings or late evenings?) please let him know that "ricky" is moving and wants to sell his Wilson 3 element beam and 3 homemade tower sections. i'm only using the one section. let him know i'm using the same tenna rotor i've been using for the last 15 years. i've got 100 feet of remeflex cable and might sell that too. buyers are giving me approx 75 days to move out so time may be crucial. glenn indicated he wanted this set up and would buy it when i found a buyer for my place.
if you hear back please post here and i'll give you my e address and phone number. thanks all.
tony, oregon

2034. Mobil Antenna Question (Newbie)

Newsgroup: rec.radio.cb
Date: 2002-01-15 21:31:25 UTC
From: buster_balz@hotmail.com
Message-ID: <f9d96d42.0201151331.1f055eac@posting.google.com>
Source record: 112422

I'm new to CB, and have a couple of questions. I understand that the antenna is the most critical part, I currently have a Firestik 4 ft. fiber glass antenna on my SUV, and a Cobra 75/WX/ST radio. I borrowed a meter and set the SWR on it last summer when I installed it. But, the range does not seem all that impressive. I am more interested in reception that transmission, is there a better antenna or a way to tune what I have to perform better>

2035. FS: Mayday 1 Emergency Two Way 40 Channel CB Radio

Source record: 112424

I have had this radio in my possesion for a few years, and only used it once.. Its in working order, and comes with the original box, the Cigarette lighter adapter, and the flexible antenna that you attach to the top. I don't have the magnetic base anymore, but its not neccessary since you can just attach the antenna to the top of the radio.. Its pretty nice still, but I have no use for it anymore. I'll sell it for $20.00 or best offer, to anywhere in the us.. The shipping should be $5.00.. so a total of $20.00

Regards,

Jesse Acosta

Source record: 112425

Since the engineer here believes that PEP is irrelevant, please explain the power levels involved in
microwave, and why that 10 watt signal is harmful..

Wait, due to the duty cycle of the waveform, the PEP might be 100 thousand watts or more, while
the AVG or RMS power of the emission might only be 10 watts.

Just something else to peak peoples interest, and maybe get them to think.

Please explain to us how that 100 thousand watt PEP number is meaningless.

Toll,
When a statement is taken out of context, it's meaning is
almost always changed. While 'Pep' ratings are not irrelevant,
how those ratings are commonly used in 'CB radio' have no
relative
meaning. It's the 'big numbers' syndrome, mine's bigger than
your's
kind of thing.
It just makes sense to measure things in units that ~are~
relevant to what you are measuring, units that have some useful
purpose. Since the majority of CB radio deals with the AM mode,
why not use a power unit that has some practical meaning for that
mode. Watts measured in 'Pep' have very little practical value
when
you speak about AM, or at best require at least one more 'step'
in
finding other relevant values.
At least that's how I look at it. But I'm not an engineer...
'Doc

>Did you ever use your formula and then plug in the numbers to validate
>it? The answer is no. The reason is that your formula does not work so
>you couldn't possibly plug in the numbers. It would expose you as a
>fraud.

The formula works for just the purpose it was intended. And that's not
-my- equation -- that's an equation from the book I quoted. If you
have an problem with it, maybe you should pick up a copy of the book
and READ IT! CLP claims he has a copy, maybe he will loan it to you.

>>2. That you didn't know PEP can be measured in P-P, RMS and AVG;
>
>You still don't get it. RMS power IS the average power.

RMS ISN'T AVERAGE! Look it up, you friggin dimwit!

> P-P is your
>term.

Peak-to-peak is -my- term? Since when?

> It has no use with standard RF power measurements.

Standard as opposed to... what? Non-standard RF power measurements?
Peak-to-peak (I will spell it out from now on) is a VERY USEFUL method
of measuring voltage, current, AND power! It just isn't the way
keyclowns measure power, is that what you are trying to say? But then
keyclowns aren't really intersted in the actual power -- you know, the
heating power? -- they just like big amps and big numbers, because it

makes them feel big.

> PEP as
>in peak envelope power is easily the most common term used to express
>peak RF power.

And that is what you keep ignoring -- peak RF power is NOT peak
envelope power! JHFC, when are you going to look this up for yourself?

>>3. That you didn't know PEP can be measured on the DC input of a final
>>AS WELL AS with a meter on the output;
>
>This subject never came up in any of my responses. Making thing up are
>you?

No, I'm not making things up. If you had known how PEP is measured at
the final's DC input you would know exactly why PEP was originally
used, and is many times still used, as a peak-to-peak value.

>>4. That you didn't know other people are capable of a more complete
>>understanding of the subject than Toll or yourself.
>
>Again you are making this up.............You know absolutely nothing
>about me. You only know how to (blow your own horn). A trait that
>you keep going back to.

You sure do have a sense of humor. In one breath telling me I'm
psychic, and the very next line you say I know nothing about you. Why
don't you go back through your posts and find out just what you wrote
about what you claimed to know. Then stop and think for a moment: If
you post what you know in a public forum, who needs psychic abilities?
Hell, all ya gotta do is read the posts! Did ya think of that one,
tnom? And if you think I'm doing this to 'blow my own horn', you need
to hone up your own psychic skills, tnom, because I can think of much
better ways to do that than posting on rrcb.

So unless you have something new to show the class, quit wasting both
our time with this 'truth by repitition' game, huh?

And here, Zerolamda, is exactly why you get no great hassle from us oldies and moldies; we remember the first DX contact and the sweaty palms. Mine was on 15 meter CW in 1956. Jim mentioned his 10 meter port which is what guys like us do when it becomes routine. And there will be the contacts you remember: like one on 20 meters at about 1 AM CDT with an SM6 (Sweden) named Olaf and an Oscar Charlie out of Peru who happened to be a sane Jehovah's Witness whose wife was on leave spending the family fortune. As it happened to be the longest day of the year, Olaf was up early because the sun got him up and he was a bit pissed. And the wacky ZL's (kiwis) and Ozzies that had the Strine so bad you needed a translator. And of course coming home from high school, firing up on 6 meters and hearing what you think is a new and very close local and having him say 'To hell with you Yanks I'm going to bed' and signing with a call from Northern Rhodesia now Zambia.

What you may not realize is that DX in the low VHF range when the spots are up is like shooting the proverbial fish in a barrel. The war stories we get from the newbies at the club are not so much frowned on because they come off CB but that the teller is so easily impressed. DXCC (100 country DX award) has been done on ten meters in a weekend; getting the QSLs is the hard part. An open 15 meters is just as productive but a bit more work. DXCC on 160 or 80cw is a first rate achievement. When Jim mentions his ten meter port, I think he is trying nicely to tell you that it ain't exactly brain surgery -- he is nicer than I am.

Carry on and enjoy the hell out of things for as long as this cycle lasts then figure out how to use the IC78 to its fullest. By the way, satellite coms are not nearly as passive as you might think.

I have a 3 foot Firestik that I use for the highway. You can't get
more then 2 miles on 19 anyway. When I need range, I put my KW-7
on the mobile. It is a night and day change.

I have never had to tune a KW-7. They work better then 102" whips.

You need to use a properly grounded mount. Magnets are Mickey Mouse.

them, so are they parking garages?
--
Wow. I'll bet that was tough to get<g>. The closest apartments are on
Forest Lakes. No, nothing so common as a park...try swamp, even though
they did name it as a park recently, so technically you are correct,
although you wouldn't have a picnic there. There is a canoe launch and a
nature center (1 room about 10 X 10) and that's it. No parking garages
close to here and there never were..closes ones are Tampa airport or
downtown Clearwater Both are about the same distance from here as the
crow flies.I'm wondering how old the photos are. You sure they're tire
tracks and not train tracks? There is a Florida power substation not too
far from here with few outbuildings, not sure how many...I'll have to
look. Not bad, though Spark, not bad.

==========
Bill Wrote:

I don't agree here either.

The 43 is claimed to be an RMS reading meter.

The 43 has a claimed accuracy, but Bird doesn't
guarantee it.

The 43 is considered the standard among many
high level CBers, but its accuracy is highly
debatable. Bird has recognized that and now
produces their "APM" (average power meter).

If you don't believe me, ask yourself the
following question: If the 43 was guaranteed
accurate when measuring average power (with
or without a specific load), why would Bird
need to come up with the APM?

Average power increases just as RMS; both can
be measured using thermal instruments. The
problem with thermal instruments is the time
required (they are slow to respond), and the
simple ones (like RF ammeters) lose accuracy

as the frequency of the test signal increases.

A true 4 watt (average power) CB signal will
increase to 6 watts at 100% modulation due to
the extra power contained in the sidebands.
Commonly available (and reasonably priced)
modern test equipment that would accurately
show that amounted to a scope and a spectrum
analyzer before the introduction of the APM
by Bird. On a 43 the same signal starts out
at about 5 watts (no modulation) and only
goes up to about 5.25 to 5.5 watts at 100%
modulation. At either extreme (no modulation
or 100% modulation) the reading is essentially
the same. In a nutshell, it's WRONG either way.

The 43 will show some figure regardless of
the shape (complexity) of the modulation
envelope. The point is that the figure
shown is neither average or RMS wattage--
it's "Bird watts." Don't try to relate
Bird watts to average, RMS, PEP, or peak
power because there is no solid relationship.
The only thing that can be said is that if
everyone were to use a Bird 43 then everyone's
measurements would be comparable (but inaccurate).
Unfortunately that's not the case.

It's the thrill of being illegal, you mean. Instead of looting part of the spectrum and imitating ham radio with your 'divisions', 'activations', DX awards, and screwed up Q-signals, why don't you guys do it legally and obtain legitimate amateur HF privileges?
-Aaron-

It's the thrill of doing it on our own, especially barefoot, with no assistance except mother nature when she has her skirt hiked way up high.

> They will perform their function (reading the average wattage
> accurately) only when the amplitude of the crest stays constant
> as in a carrier.

Bill:
That's not true.

The 43 isn't even an instrument designed to
display a true (heating) power reading. It's
just a tuned (because of the slugs) RF voltmeter
with a wattmeter scale. It will detect the
average RF voltage regardless of the amplitude
of the waveform. It has a rise and decay time
that will average out variations in the amp-
litude of the input signal.

> They can not read accurately on any waveform.

Bill:
I agree with that.

> With a constant carrier
> the 43's voltage measurement is calibrated to read the wattage. When
> you start to modulate this carrier the 43 can not longer be calibrated
> to read accurately.

Bill:
The 43 doesn't read accurately to begin with.
(See below)

> This occurs because of the square law of a power
> increase as it relates to a corresponding voltage increase. In other
> words if the 43 sees a legal 100% sine wave modulated A.M. signal it
> will read it as 4 watts. This 4 watt measurement is erroneous.

Bill:
It's worse than that. The 43 won't even show the
4 watt fundamental (sine wave) signal accurately.

The 43 shows a true 4 watt signal to be a little
over 5 watts based on what it's designed to do.
Modulation has little effect on the 43's reading.

The 43 will see the averaged voltage and read it
out on its wattage scale--that's all it will do.

> The 43 can only average the voltage on the crest of the modulation.
> The average voltage on this varying crest never changed so the 43's
> power reading will never change either. The volt meter in the 43 has
> no way to square the power increase with the increase of the voltage.

Bill:
I agree. I don't know why you're arguing with me.
The 43 really doesn't even measure the crests
of a waveform--it's too slow--it sees an overall
average.

> So in reality the 43 reads wrong and the modulated signal power does
> change. It is now 6 watts.

Bill:
The 43 neither sees the original 4 watts or the
modulated 6 watts; it reads out as about 5 watts
either way. It's absolutely wrong no matter how
you view it. Hopefully we can agree on that.

If you would have read my other posts, rather than
just the response to yours, you wouldn't have had
to write this at all.

I concur with that, Jim. I don't understand the need for thousands of watts to talk to Australia or Hungary when barefoot works. On the other hand, I don't have a problem checking out a keydown either.

>
> I don't agree here either.
>
> The 43 is claimed to be an RMS reading meter.

I can find no relation to anything being rated as RMS in Bird's catalog, other than
page 59 of common catalog...

Page 63, again dealing with a voltage. Nowhere do they claim anything having
to do with RMS watts, but the term AVG power does come up.

Page 54, shows relationship from AVG power to PEP power in pulsed systems.

RMS is a term relating to voltage.

Peak, PEP and AVG relate to wattage (yes, Peak is also related to voltage)

>
> The 43 has a claimed accuracy, but Bird doesn't
> guarantee it.

I had read that Bird guaranteed the accuracy of their meters when the meter and slug had been calibrated. That could be wrong. I haven't sent a slug in for calibration.

>
> The 43 is considered the standard among many
> high level CBers, but its accuracy is highly
> debatable. Bird has recognized that and now
> produces their "APM" (average power meter).

Their APM meters are designed for digital service.

IE, CDMA, PCS, GSM, AMPS, etc.

They measure true avg power output, while not being effected by the pulses Sparky talked of earlier.

>
> If you don't believe me, ask yourself the
> following question: If the 43 was guaranteed
> accurate when measuring average power (with
> or without a specific load), why would Bird
> need to come up with the APM?

It didn't have to do with the Bird 43 being incaccurate at measureing
carrier
or complex AM (or similiar) signals and inaccuracies, although
the digital signals from the APCO-25 systems and such produce
such problems.

The "true avg" power meters are for digital modulated systems.

>
> Average power increases just as RMS; both can
> be measured using thermal instruments. The
> problem with thermal instruments is the time
> required (they are slow to respond), and the
> simple ones (like RF ammeters) lose accuracy
> as the frequency of the test signal increases.
>

RMS is a term relating to voltage, not to measurement of power.

> A true 4 watt (average power) CB signal will
> increase to 6 watts at 100% modulation due to
> the extra power contained in the sidebands.
> Commonly available (and reasonably priced)
> modern test equipment that would accurately
> show that amounted to a scope and a spectrum

> by Bird. On a 43 the same signal starts out
> at about 5 watts (no modulation) and only
> goes up to about 5.25 to 5.5 watts at 100%
> modulation.

Bird has addressed this, and ships a card with, as well as
makes the graph available on their website.

Another reason why the PEP kit is made available to those
who want to measure AM signals on the 43.

At either extreme (no modulation
> or 100% modulation) the reading is essentially
> the same. In a nutshell, it's WRONG either way.
>

Any meter will show relative carrier with no modulation
correctly if it isn't a complex waveform (ie, multiple carriers,
modulated with any type of amplitude increasing modulation
pattern).

The AVG reading meters also take into account the nomalities that
can come up when measuring multiple carriers, or transient (or
transient looking spikes from digital modulated system) peaks.

> The 43 will show some figure regardless of
> the shape (complexity) of the modulation
> envelope. The point is that the figure

> shown is neither average or RMS wattage--
> it's "Bird watts." Don't try to relate
> Bird watts to average, RMS, PEP, or peak
> power because there is no solid relationship.

A bird 43 will show true AVG power output for a CONTINUOUS (not cw)
wave output, as well as FM.

> The only thing that can be said is that if
> everyone were to use a Bird 43 then everyone's
> measurements would be comparable (but inaccurate).
> Unfortunately that's not the case.

Hence the common acceptance of the "bird watt:".

SSB has nothing to do with RADAR.

Radar is either pulsed, or continuous carrier.

The duration of the pulses effect the average power output, while the level
of the
pulses exact the PEP value.

> Toll,
> When a statement is taken out of context, it's meaning is
> almost always changed.

I wasn't trying to take his statement out of context. I was employing
the same tactic he used to keep the debate going, as well as cloud
the fact he couldn't answer the questions posed of him, so he
solicited another method in attempting to undermine my knowledge.

While 'Pep' ratings are not irrelevant,
> how those ratings are commonly used in 'CB radio' have no
> relative
> meaning. It's the 'big numbers' syndrome, mine's bigger than
> your's
> kind of thing.

I don't agree at all. It is the responsibility of the tech to make
sure his customers know the difference between PEP and avg am
power output.

> It just makes sense to measure things in units that ~are~
> relevant to what you are measuring, units that have some useful
> purpose.

So your position is that PEP has no relevance in measuring an
AM signal as well?

Or that we shouldn't use it because some people may not know
what it means...

Since the majority of CB radio deals with the AM mode,
> why not use a power unit that has some practical meaning for that
> mode.

And it has been established that PEP and avg are both used for that.

Watts measured in 'Pep' have very little practical value
> when
> you speak about AM, or at best require at least one more 'step'
> in
> finding other relevant values.

While I understand your statement, and know what you mean, I posed a
question to Sparky. He still hasn't responded to tell the world exactly
what PEP has in relation to RMS.

Dennis O once posed a question to the group, and it also related to radar.

He also had some people wondering..

If you have an amplifier that is running low average power, but high PEP, would
you want to go up against an amplifier running high avg power, but a lower PEP?

This was assuming all other things being equal.

Just because the customer doesnt' know what something means doesn't mean the

tech shouldn't educate them, it simply means that it is an opportunity for the tech to teach them something. The flip side, too many people supposedly knowledgeable about rf have no idea about the diff between pep and avg power in an am transmitter, other than, as you said, the pep number is bigger.

> At least that's how I look at it. But I'm not an engineer...

Nah, remember.. Technicians make it happen!

lol

snip

>So unless you have something new to show the class, quit wasting both
>our time with this 'truth by repitition' game, huh?

Nothing new here....still exposing you as a fraud.

****
Example below of just one of your fraudulent claims:

"If you want to measure total power, first measure the power of the
carrier with an RMS meter (or an'averaging' meter and multiply by
1.11)"
****
Are you still sure that you can take an average reading watt meter
and multiply it's power reading by 1.11 to get the RMS power?
Because you haven't been able to figure this one out then i'll
just have to explain it to you.

Explanation below:

Your statement would be correct if it said this. In order to get
an RMS voltage with a average voltage meter (if there is such a thing)
you would multiply the average by 1.11

You seem to forget that a average AC voltage is just a mathematical
average. This mathematical voltage average is not very useful. The
average power is a different story. The average power of a circuit is
not directly related to the average voltage. The average power is
the true power of a circuit, or as some like to call it the real or
heating power of a circuit. If the average power is the true
representation of power, and if the so called RMS power is also the
true representation of power, then it's easy to see that the RMS power
equals the Average power. So your 1.11 conversion factor does not
apply to a Average to RMS power conversion. It does apply to a
Average to RMS voltage conversion.

2070. Re: Bill Schools Tnom, on Bird Meters

Newsgroup: rec.radio.cb

Source record: 112307

The Bird model 43 or any other voltmeter responds to whatever it
is calibrated to. In order for a voltmeter like this to work it must
average the rectified voltage. From there it is calibrated to read
anything you want. It can only be accurate with a constant sine
wave however. If a Voltmeter used a constant sine wave at its
input then it could be made to be accurate for reading power,
instantaneous power, peak voltage, rms voltage, or even an
average voltage measurement.

Page 6 of the broadcast Catalog calls the Bird 43 a General purpose Average reading Wattmeter for analog and cw type power measurements. Ideal for single carrier, CW,FM, and phase modulated rf signals. Everyone has forgotten about Coaxial Dynamics they too call there equivalent meter a average reading meter.

Message-ID: <1et94uct4uiju3kelpmbjq76gcd7tfiq0r@4ax.com>
Source record: 112309

Gee.....I went back into the archives to see what response I had
on this original thread. I still stand by my original take on the
subject. Here is the original copied below.
****
snip
> Bird 43s are averaging RF voltmeters with scales
> calibrated in RMS watts. They will perform their
> function on any waveform they see (within the
> confines of the particular slug).
snip

They will perform their function (reading the average wattage
accurately) only when the amplitude of the crest stays constant
as in a carrier.

They can not read accurately on any waveform. With a constant carrier
the 43's voltage measurement is calibrated to read the wattage. When
you start to modulate this carrier the 43 can not longer be calibrated
to read accurately. This occurs because of the square law of a power
increase as it relates to a corresponding voltage increase. In other
words if the 43 sees a legal 100% sine wave modulated A.M. signal it
will read it as 4 watts. This 4 watt measurement is erroneous.

The 43 can only average the voltage on the crest of the modulation.
The average voltage on this varying crest never changed so the 43's
power reading will never change either. The volt meter in the 43 has
no way to square the power increase with the increase of the voltage.
So in reality the 43 reads wrong and the modulated signal power does
change. It is now 6 watts.

2073. Hey Toll....

How about a new unit of measurement?

--- the "*KEYCLOWN WATT"!

KEYCLOWN WATT = "KCW"

1 KCW = 43 x RMS

Example: 100 RMS = 4300 KCW

(*KCW is used only at keyclown functions)

Toll,
Okay, I can go along with what your saying. I'm
not sure I understand what you meant when you said;

"If you have an amplifier that is running low average power, but
high PEP,
would you want to go up against an amplifier running high avg
power, but a
lower PEP? This was assuming all other things being equal."

Average and Pep power have a definite and fixed relationship.
Neither 'state', as you described them, makes sense, much less
comparing the two. I think your talking about percentages of
modulation, the terms 'average' and 'Pep' are commonly misused
in that way. Am I close?

Hi Jason,
It's hard to beat a hard mounted antenna, but
sometimes you are forced to run a mag mount.
The Wilson 1000 or 5000 are both very good
antenna's, along with the K40.

Well you can with a 6' Firestick that
will help. You can also go with a 7'
Skipshooter that too will help. Last,
you can purchase a pre-amp for receive,
mind you that it will also pick up whatever
white noise is on the band at that time too.

Check this out, Toll:

Vdc * Idc = Pdc
Vp * Ip = Pp
Vp-p * Ip-p = Pp-p
Vavg * Iavg = Pavg
Vrms * Irms = Prms

They all work, and they are all true. Go review your kindergarten
notes, because the term "root-mean-square" is a term related to
WAVEFORMS; not voltage, current OR power! The same with 'peak',
'peak-to-peak', and 'average'!

And don't cry about 'semantics' just because you don't understand the
basic fundamentals -- this is in the first few chapters of just about
ANY electronics book.

>But his answer had nothing to do with the question posed of you.

Oh, I see, you want to see what -I- have to say about it. Ok...,

First off, PEP isn't "meaningless", and I never said it was (or didn't you read all the times I said it was used for measuring SSB power?). What I -did- say was that it doesn't provide much information when used to measure an AM signal, which it doesn't.

Specifically, (and I am repeating myself here for about the umpteenth time) PEP is used to calibrate SSB transmitters because the modulation is theoretically infinite, and must be limited to the power that's available from the final. For that reason, the concept of PEP was invented.

In AM design, the peak RF value can be calculated more easily (and more accurately) than it can be read from a meter, even a Bird. So for that purpose there is a better method. And for measuring modulation there is also a better method, and that is with a modulation monitor, which demodulates an AM signal so the audio component can be measured seperately from the RF. It also has the nice side-effect of allowing direct audio (headphone) monitoring of the transmitted signal. And the modulation meter is a nice complement to the standard RMS meter used to measure AM power, as the symmetry of the modulated RF can be checked on the RMS meter, but not on a PEP or peak-reading meter; if the signal is asymmetrical, the RMS power will shift up or down. But you already knew that.

Now the biggest problem I can see that you and tnom are having is visualizing the differences between the AM and SSB evelopes. They are two very different animals, and I have neither the ability or the desire to describe them very well. Since I have explained -very- well the reasons for using different methods of measuring power for different signals, and knowing how you like to spin some things and ignore others, I won't even begin to explain sideband analysis. You will either have to learn that for yourself or spend the rest of your days professing your ignorance.

You see Toll, your education is not my responsibility. But your semi-accurate technobabble does an injustice to those whose title you claim without cause, and for that reason I will continue to show just how much psuedo-technical garbage you serve to the unsuspecting CBer. I consider it a public service. And I really hope you have a problem with that.

My mistake, that should be 1.232 (or 1.11^2) to convert power, and
1.11 for voltage or current.

Well Jim, I won't be flaming you for understanding why CBers use amps.
Chances are we'll all soon be hugging each other and singing
"Kumbaya" soon anyway the way things are going in this NG. The thing
is, the whole idea of communication has gotten lost on CB. Back in the
day, a few extra watts judiciously used was hardly noticeable, and
certainly wasn't boasted about or used to intimidate other CBers. At
some point CB turned from fraternal to adversarial. That's what peeves
me most and that's why I speak out against keyclowns and keyclown-ism
in all its forms.

Regarding the Tech license and its appeal to newcomers I tend to agree
with some of the outlaws (gasp!). The real magic of radio lies
primarily in HF and the fascination of discovering what propagation
can do. That's missing (mostly) in the VHF and above spectrum that
Techs are relegated to. No wonder they lose interest and go back to
old bad habits. Being disappointed is no excuse to defy the law
though, especially when a bit of effort will get you the keys to the
kingdom.

jerry, your acting and talking like freebanding is something new. its been going on since the days of 23 channels and old manual vfo's. again when you talk about hard to modify radios i only have to remind you of the hr2600 and the whole thing with the chipswitch. you guys dont give us cb'ers ner enough credit. even if the ten meter rigs are banned we can always buy a yaesu or kenwood, hell there easier to put on 11 meters anyways. and about the radio shack radio, they were dumb for buying it in the first place. you could have bought that same radio with the export chip that made it highly modifiable for the same price from your local cb dealer.

Rick,
When posting to a group made of primarily Americans it might be a good idea to put the question in American English.
Raising the twig is always a good idea. As for the radio, I don't know anything about it unless it is the radio that is like our Superstar 4900. If it is, you will only get more power on AC if there was something wrong with your batteries such as not enough current capacity or if they couldn't hold their voltage. If that is the handheld radio, can't remember Maycom model #s, a plug in power converter is a good idea to save money on batteries. Can't remember if those put out more on AC or not. Later

Toll Free wrote:

>
> Radar is either pulsed, or continuous carrier.

RADAR works on PULSES of Carrier.

If there was any remnant of a continuous carrier, it wouldn't work very well.

It fires an intense RF pulse for an extremely short period of time then turns on a very sensitive receiver to see if any of that pulse is reflected back.

The time from the leading edge of the transmitted pulse to the leading edge of the received pulse is proportional to the distance the pulse traveled before it was reflected.

The shorter the duration of the pulse, the smaller the 'blind' area close to the transmitter.

If the pulse has to travel a very long distance, and/or the 'target' has a low degree of reflectivity, the received signal strength could be very, very, low; so it is quite important that there be no 'residual' energy or leakage of the carrier from the transmitter into the receiver that could possibly cover up that reflected pulse.

Maybe you meant to say 'short pulses of continuous carrier'. or something like that.

Dennis O.

Doc,

The length of a pulse in a radar system determines the AVG power output.

The amplitude of the pulse determines the PEP value of the output.

So, if you have a radar signal that has a short duration, but high values of
output,
it would be a low avg power, but high pep system.

Pulse width modulation is a form of amplitude modulation.

However, it is in time domain.

>
> Specifically, (and I am repeating myself here for about the umpteenth

Ahh, but your the one who likes to be specific. So, it ALSO has to do
with radar, as well, right?

President Adams had a scan feature, although you had to program the diode matrix if you wanted it to scan anything but its preset.

Some of the other, more expensive, digital radios also had a scan feature. A lot of the real older radios had it as well.

You want scan, get a current, cpu controlled radio. Otherwise, yes, a company does make a kit that converts your radio from channel selector to computer control.... A direct rip off of a radio electronics magazine article from about 15 years ago.

I don't have the URL handy. Once I saw it was a rip off, with new software (the original was for the Commodore 64, to date the article), I forgot about it.

In a nutshell, without knowing what you want to use it for, no.. No radio is easy to convert for scan.

2114. Re: Power explained

Newsgroup: rec.radio.cb
Date: 2002-01-16 15:47:15 UTC
From: "Dennis W. Ostrowski" <dwostrowski@lucent.com>
Message-ID: <3C45A083.D43DEB20@lucent.com>
Source record: 112351

Where did that conversion factor come from?

Here is a hint.....

.707/.638 = 1.10815

That only works if there is no filter capacitance involved, and for full wave rectification of a sinusoidal signal with no diode losses taken into consideration.

Dennis O.

2116. Re: Newbies Bombarded By Illegal Advice?

Newsgroup: rec.radio.cb
Date: 2002-01-16 16:05:25 UTC
From: twistedhed@webtv.net
Message-ID: <28533-3C45A4C5-17@storefull-122.iap.bryant.webtv.net>
Source record: 112352

Regarding the Tech license and its appeal to newcomers I tend to agree
with some of the outlaws (gasp!). The real magic of radio lies primarily
in HF and the fascination of discovering what propagation can do. That's
missing (mostly) in the VHF and above spectrum that Techs are relegated
to. No wonder they lose interest and go back to old bad habits. Being
disappointed is no excuse to defy the law though, especially when a bit
of effort will get you the keys to the kingdom.
-Aaron-
-
Agreed. Dunno why they refuse to upgrade.

2117. Re: Scanning CB mod?

Newsgroup: rec.radio.cb

Message-ID: <28532-3C45A5B4-57@storefull-122.iap.bryant.webtv.net>
Source record: 112354

From: timnebo@aol.comLOL (Tim)
it would work great at night when the dx is low or during the solar
cycle null. they make a superstar base that scans and the 2510's will
scan after they have a chipswitch put in
-
I am afraid that a scanning CB wouldn't be much use, unless you turn the
squelch up all the way, cb is am which is very noisy compared to uhf/vhf
used by police/fire ect, which is fm and alot more quiet.
I may be wrong, this is just my opinion.

The Cherokee cb (model CBS 1000) has a programmable scan feature also.
It functioned quite well for certain purposes...like scanning your
favorite DX channels. What I didn't like was it was only able to scan in
one mode at a time.

Then what is that building directly to the WSW? -
Again, I'm wondering how old the pics are. There is no building WSW from me. The only thing south of me is a road then the water (bay). There is a power plant slightly to the east.

You're right about that. Very few people aside from keyclowns have much experience with deliberately "jamming" other signals. Preventing a radio signal from being heard is something that the US military has perfected though. Maybe you keyclowns ought to consult with them for advice.

Bli-Ben:
IF the empty space on the 23 channel dial is between 23 & 1, then it is a 40 channel CB with a 23 channel dial. If not, it is an old crystal type. I use to work @ Hy-Gain in '77 and may have a few switches left (which your Pearce is probably from the same mold as the Hy-Gain or Midland), but I don't know about the dial crystals for the dial. For a time people could send in their 23 channel units to the factory and they would convert them to 40 channels. The 40 channel Hy-Gain 9 would read up to 50 IF converted to do more, and the 23's could do 40. Digital readout to 50! You commies don't like that, do you?! SO WHAT !

You heard correctly. There's not much on the public web sites about it because it is basically
a CAP/USAF internal change. Up until several years ago, even tho CAP is a USAF Auxiliary,
its communications were subject to FCC licensing and certain of their rules. In an overall tightening up of the USAF/CAP relationship AND memoranda concerning the sharing of com-
munications resources between government agencies, CAP went under the direct control of
US Air Force Frequency Management, and all civilian control (FCC) was relinquished. Due to
the fact that all military and government communications are controlled by an agency called
National Telecommunications and Information Agency (NTIA), the standards are MUCH tighter with respect to frequency tolerances than that of Amateur and other civilian communica-
tions. SO, that meant that CAP had to upgrade its equipment to meet these tighter standards.
Due to the fact that there was much Amateur HF and VHF equipment being used on CAP
frequencies, there was a "sunset" date set about 7 years ago for this equipment. That date just
passed on 31 December whereby equipment that did not meet NTIA standards had to cease
operating. Yours truly is out of business on VHF FM CAP-wise for the time being, but that will be rectified soon. I am currently looking at equipment from Tait and Kenwood's TK-series
of commercial/military equipment that meets the VHF narrow-band criteria. The HF frequen-cies will remain the same for now. WE DO know that the VHF frequencies will change in the
next year or so.

Many of the HF radios, or the more modern ones, can be made compliant with the addition
of an optional TCXO option. Icom 706, 746, 756, Kenwood TS50, TS450, TS850, are
some examples of Amateur gear that can be made NTIA compliant. My HF rigs are IC706s,
and, yes, they have been modded to operate outside the Amateur Bands (GASP!) But because they meet the NTIA standards, it is perfectly legal for the use to which they are put.

The reasons for all these changes, while they may seem like a lot of trouble, is to give greater
flexibility in emergencies (such as Sept 11) and allow communications with

other gov't agencies
as well as the other branches of the military. We can now, under certain guidelines, operate on
a variety of USAF, Army, Coast Guard, FEMA and other frequencies whereas we were "stuck" on our frequencies and the other agencies were likewise bound to theirs. It is not uncommon now for FEMA to come up onto one of our HF frequencies and request traffic with
a certain city, person, or relay to a person, place, or agency. We now coordinate freely with
USAF sometimes providing relays and phone patches for hurricane spotter planes. We even
have our state's (NC) VHF Highway Patrol frequency in our state communications vans. We
can coordinate with local and state rescue agencies on their 155 MHZ frequencies if need be.
However, we can't just "freeband" on those frequencies; there has to be a reason to be using
such frequencies such as an ongoing search, responding to a disaster, or requesting NCHP
escort to a disaster scene.

The frequencies we use are, and have always been, USAF frequencies, and they range from down on 2 MHZ to 30 MHZ and certain VHF frequencies. While the actual frequencies are,
I suppose, published in books and on the web, I, as a member of Civil Air Patrol, am not allowed to divulge them. Some of you do, however, remember me complaining about inter-
ference from illegal operations down in 26 MHZ area. The prohibitions against revealing
frequencies come from NTIA and is a recent change from the more "open" civilian style of
years past. It is because USAF's "little brother" has become more and more integrated into
its parent organization's structure and been given more and more tasks to do. Training is more
stringent, requirements for filling staff positions have become stricter, and emphasis on profes-
sional development as members and officers is stressed much more than in the past. We spend
many weekends a year training for the "usual" incidents as well as the September 11th attack.
The first aerial photos of the World Trade Center were provided by New Your Wing, CAP.
CAP was the only agency allowed to fly, other than the regular military during the rigid no-fly
period following the attack.

For more info, go to Google Search and type in Civil Air Patrol. You will find many websites
where many of your questions will be answered. I hope I have helped with your questions.

I met a guy years ago who had a CB that scanned the 40 channels. It
was fully operational (tx/rx), complete with lock-out and priority
channel features. He said it was one of a number that were specially
made years ago for law enforcement to better "read the mail".

It worked great, wish I had one...

Thank you for your response Jerry, We use some TK line radios here with our disaster response team. specifically TK-340D HTs although our license involves UHF freq's in the 450Mz range. I was not particularly interested in the frequencies, as I myself am not a member of CAP, although one of my disaster team members is, and I know that he is somewhat short funded due to his ex-wife's raking him over the coals. I was more concerned with helping him find out what type equipment he would need and then to help him find the best deal for his dollar.

Keith

2135. Re: 23 channel to 40 upgrade kits?

<drool!>
Yes, they are all old crystal types.
I would love to know more... Thanks!

Bliben

2136. Re: FCC will stop part accepting AM 40channel CBs only CB SSB radios will be manufactured

Newsgroup: rec.radio.cb
Date: 2002-01-16 19:39:25 UTC
From: Jerry Oxendine <joxendi@bellsouth.net>
Message-ID: <hDk18.54123$V55.3467479@e3500-atl1.usenetserver.com>
Source record: 112373

No, it isn't something new. The difference was that even the freebanders
didn't venture onto 10
meters. The FCC has to bear some of the blame for this because they
abandoned CB enforce-ment and left the legitimate operators to the lions.
Some FCC spokesmen now freely admit that
that was a bad mistake and led to the situation that exists now up on 10
meters. Now, there are initiatives under way as how to stop it. It may,
indeed, be too little, too late, but I certainly
hope not. I just know that promises have been made by certain FCC people
(RH, for one), and I expect the promise to be kept. I think I have just as
much right, no, MORE right, to use the spectrum that I EARNED the privileges
for than some trucker that just goes to some unscrupulous truck stop, buys
one of "them-thar reddios with them 'extra' channels" and goes
to talking right on top of me and all the other guys who respected the
regulations enough to
fulfil the requirements for its use. I have nothing against CBers, and as
long as they don't bother
me, I don't care what they do in the 40 channels allotted to them. It's
only when I am operating
on my assigned frequencies and someone who is not even authorized to operate
there just comes up and starts his "beep-squeak!!" sh** that I am ready to
start high powered fast CW right over the top of him, calling CQ de K4***,
and there isn't a damned thing he can do about
it. I don't owe an illegal station the time of day, much less the courtesy
of standing by while he
usurps frequencies, not only from me, but from amateurs all over the world
whose operating
privileges have often been negotiated by treaty. I am not all that worried
about 27.555 because
I figure that if the legal users of that frequency WANT something done about
it, it will get done.
FCC HAS hit "freebanders" in the past--they just don't do it enough to prove
that it is not worth the risk.

The 10 meter issue is a different matter (Voobner not withstanding). It DOES
affect me. It
DOES make me angry. And, like many other hams who are pissed off about
this, I listen to
the lower end of 10 meters--especially when I am out driving on the
Interstate. I WILL turn
in truckers I have documented proof are operating on 10 meters. I WILL
follow up with com-
pany names, truck numbers, tag numbers, photos and tape recordings. If he's

on 27.555, it's
not my place to bother him, and I won't. (Voobner notwithstanding again).

2137. Legal???

Newsgroup: rec.radio.cb
Date: 2002-01-16 19:41:13 UTC
From: espo1@webtv.net
Message-ID: <1867-3C45D759-7@storefull-223.iap.bryant.webtv.net>
Source record: 112375

with a subject like "Legal" I know it would catch the "eyes" of this NG
I have been reading this NG for a while and found that AH Voobner is the attoney pro bono here. Anything asked or inquired that is illegal brings AH to the top.
What is up AH? the same freedom of speech you stand behind is not the same for someone else's information?? when someome asks what a linear is worth I can count on you to tell us its illegal,,asked for a price NOT a law review,,asked about a freeband again you respond.
Other NG'g such as rec,guns mamy questions about weapons full autos,,destructive devices etc, while maybe illegal to buy,sell or own, are NOT illegal to tell,talk, think about.
I do not incourage or condone any illegal acts or lawbreaking,,laws keep us free and this is still a FREE country,,we are not a communist state and do not need or should have someone like yourself watching every word printed here,,we dont send people to jail for talking about linears ,,or freebands or machine guns,,nobody here is yelling 'Fire" in the movie house..
Knowledge is power,,if you don't know ask someone who does,,,asking ain't illegal
get it?? lighten up AH
Fred

A president Jackson is fine for the 11m band you don't need to be going way into the 10m ham band but it does cover all or most of the 11m band and sounds realy good if you tune down its output power and put a d104mic on it.. or you could look for an uniden hr2510 both being bought in good used condition should be under 160.00 us dollars

Dude first of all in the mircowave bands you don't need alot of power
this is due to the nature of that band and the frequncy of that
band.. thats why cell phones and other cordless phones don't hardly
put out a watt of transmit power or it could fry your brians or
something like that... you know like your mircowave oven they put
out like from 400watts and up

Toll,
That's sort of a 'long reach' isn't it? I do know how
radar works, but what has that got to do with what is being
discussed? Your confirming what I had said, the units of
measure should be picked so that they convey meaning pertinent
to the mode in operation. I've seen one or two CB radios
next to radar consoles, but never any radar built into CB
radios, and about the only thing 'instantaneous' about CB
radio is the sound of transistors 'popping'.
By the way, radar is the only mode in which ~you~ modulate
~their~ signal, and ~they~ modulate ~your~ signal. Sort of
makes you wish that applied to a lot of other types of signals,
doesn't it?
'Doc

OK, how about "TFW" (Toll Free Watts)?

1 TFW = 3000W RMS

-Aaron-

2147. Re: Bill Eitner Explains Bird Watts

If you are seeing 22,000 watts on a bird 43 you are seeing things.

Sparky,
Remember when I said not to be too hasty?

You said;
"Specifically, (and I am repeating myself here for about the
umpteenth
time) PEP is used to calibrate SSB transmitters because the
modulation
is theoretically infinite, and must be limited to the power
that's
available from the final. For that reason, the concept of PEP was
invented."

SSB modulation has the same constraints as AM as far as
modulation
is conserned. "Theoretically infinite"? Nope, not by a long
shot. And
your contradicting yourself from the previous sentence.

Dennis,
It can also work with a continous wave. The receiver
is 'filtered' so that only the signal excursions due to
reflection is 'received', or more correctly, sent to the
display. A 'CW' radar has a much lower power rating, and
therefore has a much shorter range.

The firestick should work very well, although the longer the better. The true fly in you soup is the ground plane on your RV. You probably have little or none... or expect a small mount to act like an idea circular plane. It ain't gonna happen.

In a lot of commercial two way radio work I've done... a large piece of metal would be glued to the top of the RV with silicon, then grounded if required. On a VHF & UHF radio, the glued plate was often all that was required for proper operation. On some vehicles, I even ran a ground wire down to the vehicle frame.

Since the vehicles were public safety, the installs were often done at County Coporation Yards where their street repair people would supply unpainted traffic signs for the job. Worked great... you might consider something like it.

cheers
skipp

Umm

Electronics Now! (formerly radio electronics) would have the article.

I have also seen someone do it on a PC, as I stated earlier. I <<believe>>
it went via parallel port, but I'm a little foggy on that one.

Simple BCD or Binary adders do the job.

> Dude first of all in the mircowave bands you don't need alot of power

No?

The reason you don't need a lot of power is because of the size of the
antenna.

It is much easier to build a high db gain antenna in the microwave region
than
it is to do at say HF.

However, you DO need a lot of power to communicate with the microwave
bands... Its just easier to do so with the antenna gain than it is with a
bigger tube / exciter / pa.

> this is due to the nature of that band and the frequncy of that
> band..

The nature of the band and the frequency of the band.

The band encompasses the frequency. That's like... A double
negative or something.

thats why cell phones and other cordless phones don't hardly
> put out a watt of transmit power or it could fry your brians or
> something like that...

Yeah, or something like that.

They don't put out but a watt of power because people aren't sure
WHAT the effects of microwaves are.

And cell isn't microwave. Its UHF (depending on who you are talking
to, UHF can or can't encompass 800 megs... ./end sparky protection)

you know like your mircowave oven they put
> out like from 400watts and up

And do you know why? To cook the items in them
from radiation bombardment. (EMI, actually).

Dave,

Is it true or not that the tech's in the field, licensed techs, could also
put these in a radio,
as long as the instructions where followed implicitly.

I knew the factory could do so, but I was under the belief that a shop could
do
so as well, as long as they had a licensed tech in the shop.

Well. you have your right to ypor opinion, but the fact of the matter
remains. And I am not bragging, I never would have brought it up if it
weren't for your original remark/insult.

Without volunteers from organizations like the American Red Cross, Salvation Army, ARES, and many other VOAD's, who would people get help from after a hurricane, a tornado, or a eathquake?

Can I help if I am proud to be a part of such organizations? Kinda like you being proud of your radios and your amps, and your ability to thump someone in a "keydown". So if I am a "braggart", what does that make you and your kind who brag about your power. At least the many people I work with are actually helping people, ad are having a positive impact in their communities. Call me what you wish I do not give a flying puck. As I have always said, if people do not like me for who and what I am, screw them I don't need them anyway.

Keith

Gang, before we get our collective panties in a knot, understand something. A LOT has to do with the waveform. A class A amplifier typically will have around 25% efficiency. This is with normal (whatever that is) audio or a sine wave. If (IF) you were to feed a square wave into that class a amp and IF you approached (very closely) saturation and cutoff, the amp would still be linear, but you could have 70, 80% efficiency. Special case. Same with this RMS, average, peak, and whatever. Take a 1 KHz sine wave vs a 1 KHz square wave. Same peak amplitude. That square wave will vary between -100% and +100% of the peak voltage while spending virtually no time in between those limits. It's average voltage will be the same (averaged for 1/2 wave)as its' peak voltage. It spends, in theory, no time between its' maximum limits. The sine wave spends a lot of time between those limits. It spends virtually zero time at the peak limits. It's derivitave, the cosine, shows that it is changing value at the maximum rate when it hits peak (known as 'let's get the heck out of here'). Now what is its' average voltage (averaged, of course, for 1/2 waveform). Now, what is its' EFFECTIVE (heating effect, power, whatever). The square wave with the same peak amplitude as the sine wave has a lot more effective power contained therein. There is a difference, gang. Integrate the area under the curve. Now we can go back to calmer subjects - like the fact that to find power one also has to consider any phase angle difference between voltage and current (i.e., at a 90 degree phase shift - possible only in theory - there is NO power being dissipated. It is simply stored in a capacitor/inductor to be returned later in the cycle.

I don't know. I doubt 15. Usually by 15 one can continue for at least a couple of sentences without stuttering, stammering, or totally forgetting what one is trying to say. I estimate his age at 12 or 13.

2161. MasT Material-Does it matter (and a few related questions)?

Newsgroup: rec.radio.cb

Source record: 112454

Hi,
10ft conduit 4.99 Home Depot
10ft Mast Radio Crap 15.99

Can I use the conduit and save or does the mast need to be a certain material for grounding?

Also, on a Big Stick antenna, where should I connect the ground...to the bottom of the mast or to the antenna mounts?

For TVI prevention, should I coil the coax 6-8 around the base of the mast?

Must I also ground the coax or radio, or will the ground from the antenna be ok?

Lots of questions...I need help/answers. After 15 years, I have decided to hook up my station again and want to do it right this time. Money is also a consideration so If additional grounding isn't necessary, Id rather avoid the time and expense.

TIA

>
> <<< LOOK IT UP !!! >>>

When speaking of power, the average power of a carrier
is the same numeric value as the so called RMS power.

As long as you provide decent support between elements (I use gas pipe
cut to 2 foot, with PVC pipe around that) and guying, that will be fine.

> Can I use the conduit and save or does the mast need to be a certain
> material for grounding?

No, you run a ground to the antenna.

>
> Also, on a Big Stick antenna, where should I connect the ground...to the
> bottom of the mast or to the antenna mounts?

Ground the base of the mast
Ground the bottom of the bigstick
Insulate the BigStick from the mast using a piece of pipe or some
inner tube rubber.

>
> For TVI prevention, should I coil the coax 6-8 around the base of the
mast?
>

6 to 8 turns, 10 to 12 inches in diameter, depending on the coax.

> Must I also ground the coax or radio, or will the ground from the antenna
be
> ok?
>

No, ground the radio to the same ground rod you ground your antenna to.

Also anything else in line should be grounded as well.. Linear, wattmeter,
etc.

> information). Pulse-width modulation is P2E and P3E.

If you have CW, you also have pulse width modulation. After all,
the width of the cw pulse (when using a keyer, for precision) and
the width of the "off" period determine CW speed.

Some people here have compared CW to AM, since it REALLY is
the amplitude varying that conveys the intelligence (although that variation
is from 0 to full power, and at a rate = to the WPM of the person sending)

>
> >> Specifically, (and I am repeating myself here for about the umpteenth

Why are RADAR tubes rated with PEP values then?

The
> only thing I claim is that the power of a radar pulse can be measured
> using the same method used to measure PEP, and the purpose for
> measuring it is the same: To calibrate the transmitter so the peak
> doesn't exceed the capabilities of the final.

So then, you use the PEP meter to calibrate the xmitter, but the value you
get is
arbitrary, since PEP isn't used or useful in measuring RADAR signals

"> No, because there is no modulation envelope. Peak-ENVELOPE-power."

If the PEP reading meter isn't useful, since it isn't measuring a mod
envelope,
then how would you know when your exceeding the capabilites of the
final....?

Actually, before I posted this, I ran a search.

Scanner mfg'ers tend to NOT include 800 megs in the UHF region.

I have to make everything fit the common man, as well as senor bookworm now.

Common inferences, annotations, references and the such can't be taken for granted,
or the semantic police might come a chasin.

Ask and you shall receive

"Average power output of an amplitude modulated
transmitter.....
The radio frequency power delivered to the transmitter
output terminals, averaged over a modulation cycle."

NOW JUST WERE IS IT THAT IS SAYS AVERAGE POWER
USES AVERAGE VOLTAGES AND CURRENTS?

"Power.....the rate at which work is done. Units of power
are : the watt, the joule, and the kilowatt."

"Root mean square value..... Of alternating
currents and voltages, the effective current and voltage applied.
It is the value of alternating current or voltage that produces the
same heating effect as would be produced by an equal value of
direct current or voltage. For a sine wave, it is equal to 0.707
times the peak value."

Gee......If it takes an RMS value of Voltage and Current in a sine
wave to get the effective power, and if the average power is actually
power as per the definition, then it's easy to see that only the
misguided would use an average value of voltage and current in a sine
wave to get the average power.

I think we all understood that much, Toll. What I think he was
referring to was the comparison of low-power/high-PEP to
high-power/low-PEP. And that's probably why he quoted the question.

>If you have an amplifier that is running low average power, but high PEP,
>would
>you want to go up against an amplifier running high avg power, but a lower
>PEP?

If the purpose of going "up against" another amplifier is to jam it,
you really need that big carrier. In fact, that's ALL you need. But
you might want to add a little signature modulation. So for that
application you want the lowest PEP to AVG ratio possible.

But if you want to communicate, you will probably want a little bit
more modulation mixed in with that carrier. Better yet, throw out the
carrier and a sideband. That way you can concentrate all your power on
the one sideband instead of wasting it carrying all that excess
baggage.

Ooops, I forgot that most of these keydown amps don't run SSB very
well... oh well.

Not really, since the purpose of radar isn't to communicate. And pulse
modulation isn't A3 or even A1, it's P0 (pulsed carrier without
information). Pulse-width modulation is P2E and P3E.

>> Specifically, (and I am repeating myself here for about the umpteenth

>Ahh, but your the one who likes to be specific. So, it ALSO has to do
>with radar, as well, right?

No, because there is no modulation envelope. Peak-ENVELOPE-power. The
only thing I claim is that the power of a radar pulse can be measured
using the same method used to measure PEP, and the purpose for
measuring it is the same: To calibrate the transmitter so the peak
doesn't exceed the capabilities of the final.

I believe I stated before that max peak power on AM is four times the carrier power. The required limitations of an AM final is easily calculated from the AVG or RMS, or the max carrier power can be calculated from the transmitter limitations.

> "Theoretically infinite"? Nope, not by a long
>shot. And
>your contradicting yourself from the previous sentence.

Of course it's "theoretically infinite" because you don't have a carrier power to reference the modulation index. In fact, SSB doesn't even have a modulation index! The only limitation of SSB modulation is the physical limitation of the transmitter. And since 'theoretical' isn't 'physical', there is no contradiction.

Get an Antron99 or ground plane type antenna up in the air a bit, and get your swr down to 1.5 or lower, and you will be able to hear alot of transmissions more than just ☐faintly.☐ You should, with this $75 setup, be able to talk all over your local area for 20 or 30 miles or more with no problem at all with the radio that you already have if it works properly. When atmospheric ☐skip☐ conditions permit, you will be able to talk worldwide on 4 watts.

The reason for using PEP is that RMS or average power is not sufficient
for SSB, like it is for a properly modulated AM signal.

> SSB modulation has the same constraints as AM as far as
> modulation

True. The modulation ability is not infinite. But for those that get
their jollys out of "swing", you get an infinite percentage swing.

I don't talk about hams like that at all.

Your just used to the asshole mentality of "Im going to throw all the problems at someone else to get the heat offa my back".

I operate amateur, as well as CB radio frequencies.

I operate with various power levels. Some within FCC regs, some not..

Just because I operate in one service one way doesn't mean I am going to disassociate myself with another, you moron.

Depending on what he is looking for, he should be able to find plenty of used HF gear that
can easily be made compliant. If he is looking for VHF gear, he might want to look at the
Tait 2000 VHF at around $369.00 from the CAP Supply Depot. Most likely his Wing director
of communications will have the programming software for setting it up according to his Wing's
comm. plans. One way to determine what is NTIA compliant is to visit the National Web Page(again easily found on Google) and go to the communications section. He can then find a list
of compliant radios that meet his needs.

Hehe! High speed CW is very difficult to block out. It would be my signal interferring with
him rather than the other way around. Besides, if I am on my on "turf" calling CQ de K4***,
and I happen to "bother" a local trucker, how can I be expected to "know" there's a bootlegger
on there, or how can I know that no one's going to answer me. <<wink wink>>!

I think you must be confused. I never tried to stop anyone from
posting anything. I never said telling, talking or thinking was
illegal. When I say "newbies bombarded with illegal advice" for
example, I mean they are advised to do illegal things, not that the
advice itself is illegal.

> I do not incourage or condone any illegal acts or lawbreaking,,laws keep

In some cases there are folks selling amps via the NG that are clearly
illegal. If you care to hear the FCC regs regarding this I will repeat
them for your benefit. Otherwise feel free to post anything you like.
If I care to comment on your posts, I will do so, as is my right.

Jason,
If your only speaking about 10 feet, the conduit will
probably work as well as the 'mast'. If your talking about
more than 10 feet, or so, use the 'mast', it's much stronger.
It isn't a matter of 'grounding', it's a matter of of resisting
the the forces on the mast (primarily wind).
With a 'Big Stick' or any other antenna, one end of the
ground wire should be connected to the antenna or it's mount.
The other end goes to ground (naturally).
The coils of coax compose a 'coaxial-choke', which should be
at the antenna, not the base of the mast. A 'choke' does help
prevent TVI/RFI, but it isn't a 'cure-all'.
It never hurts to provide a ground for your radio, and any
other equipment in your 'shack'. Equipment ground should be
as short as possible, and for CB radio, should not be multiples
of 9 feet (or close to it). A ground wire 9 feet long provides
no RF grounding at CB frequencies. The same for any length thats
an 'odd' multiple of 9 feet. 'Even' multiples are okay.
The ;other' reason for grounding is electrical safety, and
a 'safety' ground is always desirable.

It won't be accurate except at a case of at or very near 1:1.

Then, depending on the meter, it could still be inaccurate :/

It's been done and depends largely on the meter; I have used a RS cheapie
with good results on 461. I sure as hell would not depend on the
calibration however but it may well be a good relative indication.

Source record: 112485

I was working in a 2-way radio shop when the 40 channel radios came out. We discounted the 23 channel radios a lot. I got a Cobra 138 (23 channel AM/SSB) for $60. I still have it, still works, but I modified to 10 meter Amateur and have worked the word with it. Anyway, at the time ALL CB radios had to be "FCC type accepted" so there could be no legal means of modifying a 23 channel radio to 40 channels. (Actually, there was no legal way of modifying a CB radio, period.)

I hope this helps.

When are you going to get it. What I am saying is true. A quote
specifically for you, Sparky *

" However, the term RMS, average and peak have different meanings
when they refer to AC power. The reason for this is that while voltage
and current are sinusoidal functions of time, power is the product of
voltage and current, and this product is a sine squared function. The
mathematical operations that define RMS, average, and so on will
naturally yield different results when applied to this new function.
The relationship between AC voltage, current and power follow:

RMS voltage X RMS current = average power "

I'l repeat because you are hard of hearing.............

RMS VOLTAGE X RMS CURRENT = AVERAGE POWER

* taken from page 2-13 of the 1989 ARRL Handbook under

Ok here goes:
I have a radioshack TRC-442 and have it straight wired with a toggle switch from my battery. It is grounded to my dash with 2-4 inches of 16 gauge wire. The antennae is one i picked up at AutoZone for around 25 bucks. It's one of those magnetic mount 4ft ones. I got the coax running into my door and on the floor into the back of the CB (radio is where the ash tray used to be). Anywho, as long as the car is off, and the key not in the ignition, I pickup around 5-10 miles. But for example when I open the door, I can hear the door buzzer through my CB speaker and as soon as I crank the car, I get a butt load of static and my recpetion goes down to 1-3 miles (that's pushing it). I checked my antenae wire and it isnt near any power wires so I wonder if any of you can provide insight. This is different for me as I am used to hooking up stereos and speakers. By the way, it's a 86 Dodge Aries Wagon.

That's telegraphy, which can be done by pulse width, position, phase
or tone. I think it's fair to assume that telegraphy isn't normally
used in radar applications.

If you want to argue semantics any more, maybe you should keep a
reference book handy.

>Some people here have compared CW to AM, since it REALLY is
>the amplitude varying that conveys the intelligence (although that variation

Whoa! Where did you get that? I said the same "method" can be used.
And where did I say anything about the value being arbitrary?

> since PEP isn't used or useful in measuring RADAR signals

I think your imagination is running free there, Toll.

>"> No, because there is no modulation envelope. Peak-ENVELOPE-power."
>
>If the PEP reading meter isn't useful,

I didn't say that either, Toll. Trying to take another spin?

> since it isn't measuring a mod
>envelope,
>then how would you know when your exceeding the capabilites of the
>final....?

Somehow I knew you would get confused about this. Maybe I can simplify
this a bit with an analogy using your logic:

P: You can measure water with a measuring cup.
P: You can measure flour with a measuring cup.
C: Water is flour.

Now put that to a Venn diagram and see what you get.

>output terminals, averaged over a modulation cycle."

And only now, after all this arguing, you provide a quote which clears up the entire problem.

" The average value tends to be confusing to the beginner. He confuses "average" with "effective," probably because it seems that the average value should represent how much work the ac cycle should do. As pointed out previously, however, it is the effective, or rms, value that does this. To summarize, for sine-wave ac:

Ac peak value = 1.414 x effective value
Ac effective value = 0.707 x peak value
Ac average value = 0.636 x peak value
...
At this point it might be well to advise the beginner to disregard the average value temporarily. Later, in Chaps. 11 and 12, in the study of meters and power supplies, when ac is changed to pulsating dc, the average value is used." p. 66

And from Chapter 12:

"...The bridge rectifier converts ac into pulsating dc and produces a deflection equivalent to 0.636 (the average value) of the ac peak. It is standard practice to calibrate the face scales of ac meters in effective values...
...
If a half-wave rectifier is used, the average value is half the full-wave value of 0.636, or 0.318." p. 245

"Electronic Communication", Shrader.

I have a 40' mast that uses interlocking fence pipes. I even built a
base with a hole so I could run my coax inside the pipe. Top it off
with a short section of thick PVC pipe. Works fine.

>Also, on a Big Stick antenna, where should I connect the ground...to the
>bottom of the mast or to the antenna mounts?

Don't use the mast for an antenna ground, but ground the mast
seperately outside for lightning protection.

>For TVI prevention, should I coil the coax 6-8 around the base of the mast?

If you run it inside the mast, you don't have to worry much. You can
coil it around the mast, but do it at the base of the antenna, not the
base of the mast. You could also put some ferrite beads around the
coax just below the antenna. If you don't have ferrite, a short piece
of stainless-steel tubing works in a pinch, just not as well.

>Must I also ground the coax or radio, or will the ground from the antenna be
>ok?

The antenna has it's own ground -- the "ground-plane" or the
"counterpoise". But you need to ground the coax at least once for
lightning protection before you send it into the shack. It is best to
ground it with a full 8' ground rod both at the base of the mast -and-
at a point just outside the shack. Regardless of how good your ground
may be, ALWAYS disconnect the coax from the radio for a thunderstorm.

>Lots of questions...I need help/answers. After 15 years, I have decided to
>hook up my station again and want to do it right this time. Money is also a
>consideration so If additional grounding isn't necessary, Id rather avoid
>the time and expense.

Don't use cheap coax. Foam dielectric coax sucks and you will just
have to replace it every few months. Sometimes you can find a partial
roll of good stuff at the local recycling yard. Don't use twist-on or
crimp-on connectors, either. You can make a good, thick grounding

strap by braiding together several lamp cords. Just use your
inginuity.

Fine.

>The relationship between AC voltage, current and power follow:
>
>RMS voltage X RMS current = average power "

If that's what it says, in context, then the author is wrong, and
contradicts just about every authoritative reference. Maybe what you
are confusing is the phrase "average power" as used to describe an
average of power readings over a given length of time, which is very
improper because it causes just the type of confusion you are having.
In that case you should probably use a term that better describes what
you are saying, such as "average RMS" or "average PEP", but NOT
"average power".

>Better brush up on your fundamentals.......... eh?

Yes, you should.

Not the greatest information, as you will distort the radiation pattern of
the antenna.

The Big Stick is basically a dipole, with its feedline brought back around
the shield (bazooka). Decoupling it (because it does have a matching
network in the base) is a good idea.

You can
> coil it around the mast, but do it at the base of the antenna, not the
> base of the mast. You could also put some ferrite beads around the
> coax just below the antenna. If you don't have ferrite, a short piece
> of stainless-steel tubing works in a pinch, just not as well.

Also, you can use a choke made of steel wool. A paper towel roll is about
the right measurement.

Full it with steel wool, and at the end lowest from the feedpoint of the
antenna connect the steel wool to the sheild of the coax.

Coiling your coax is a much better option, though. Ease of construction.

>
> >Must I also ground the coax or radio, or will the ground from the antenna
be

The Big Stick is a dipole type antenna. Has counterpoise, has no
"ground plane", per se.

Grounding the coax at both ends also helps prevent incidental radiation
from the coaxial cable.... Which is compounded when not using
a choke at the feedpoint.

The Big Stick style antennas are also fantastic TVI creators, due to
front end overload, and whatever you plug in at the radio end.

Whatever help you can give them is good.

It is best to
> ground it with a full 8' ground rod both at the base of the mast -and-
> at a point just outside the shack. Regardless of how good your ground
> may be, ALWAYS disconnect the coax from the radio for a thunderstorm.

Also, use some type of cable to tie your ground rods together. This keeps
the
sheild from having to carry other currents upon itself.

More case of arguing over semantics. Telegraphy conveys information
by the on and off pulses from the keying device, be it a switch, transistor,
dedicated keyer, etc.

PWM does the same thing.

Therefore, the measurement devices can be the same.

>
> If you want to argue semantics any more, maybe you should keep a

PWM conveys analog information.

>Therefore, the measurement devices can be the same.

And your point? Oh, that's right, you were trying to explain how radar
is the same as AM, and in the process you keep on pointing out your
lack of familiarity with RF terminology. Call it semantics if you
want, Toll, but the bottom line is that you keep demonstrating your
lack of knowledge on the subject.

>> If you want to argue semantics any more, maybe you should keep a
>> reference book handy.
>
>
>I was never one for arguing semantics. Thanks for your admission, though.

Then why do you keep bringing up all these inaccurate definitions? You
can look them up yourself before you post, and that way I wouldn't
have to set you straight all the time.

FWIW,

I purchased a new 8-pill from Steve a few years ago and while it may of
worked it was terribly inefficient.

Dennis #12 done considerable work on it.

End result 950 real avr watts, decent bias ccrt for SSB operation and a
filter in the output.

950w may not sound much but they were clean!

I still have it sitting on top of the Metron.

Which would you prefer?

Does a stock 'Out of the Box" radio work well?
Or.....
should it be peaked tuned for a few extra watts? Curious if I needed to have elaborate tuning to get more than a half mile.
Also, a dealer I communicated with said that the CB's he has can get extra channels, but only above the CB 40, not below. Is the below 40 channel area only available with an export radio? Does anyone know of a CB or dealer that can do a CB to include both lower and upper.
I don't think I want to get into the export radio arena, but wouldn't mind a little exra power and the capability to listen to the bands outside of the regular 40.
** I am aware of the legality issues associated with the modifications I seek. ** I was only going to use the radio while in Brazil :-)

There was a lot of confusing info floating around when the 40 channel radio first became legal, as well as a lot of rumors. Many people believed that the 40 channel radios were only rated for 2.5 watts of power out. Others were told that the radios didn't "talk" as well. There were other rumors as well. This prompted many people to decide to keep their old 23 channel radios, but wanted a way to "upgrade" them to 40 channel capability. Most just bought crystals, or a VFO, and didn't give the legality issues a second thought (see not that much has changed).

>From what I remember (And after 25 years, it may be a bit sketchy), the FCC changed the rules for type acceptance, which corresponded to the release of the 40 channel radios in jan of 1977. Among the changes in type acceptance rules were:
No more crystal synthesizers. All 40 channel radios had to be PLL.
Harmonic suppression jumped from -40 to -60 db.
Tighter modulation limiting.

The FCC allowed a "grace period" where sales inventories of older 23 channel radios could be reasonably sold off. I don't remember the exact cutoff date, but after which, it became illegal to sell a NEW 23 channel radio (used radios were ok).
Many companies saw the new rules and designed radios that were capable of passing the stricter type acceptance rules prior to jan. 1977. But they could not sell them as 40 channel radio before jan 1977. So they sold them with 23 channel dials. Those that were still in the factory (and I THINK unopened dealer's stock that were shipped back to the factory), when jan 1st rolled around, were allowed to be "remanufactured" up to 40 channel standards, provided that they were not already sold to the end users.

I do seem to remember that aftermarket modifications were specifically not allowed. This was mainly due to the logistical difficulty of

tracking which radios adhered to the newer standards, and which ones didn't. So they took the easy way out and prohibited all of them from channel upgrades.

And AM doesn't?

>
> >Therefore, the measurement devices can be the same.
>
> And your point? Oh, that's right, you were trying to explain how radar
> is the same as AM,

No, I was trying to explain how they where similiar, and the measurements
of peak envelope power where benificial when measureing for both.

and in the process you keep on pointing out your
> lack of familiarity with RF terminology.

lol.

In the interim, I showed that you know little to nothing about practical
applications, and only what you have been told in a classroom / read
in a book.

Books aren't bad, but when an engineer does nothing but put his head
in the sand when someone else has a different theory / different application
then he really DOESN'T care about what he is doing.

Call it semantics if you
> want, Toll, but the bottom line is that you keep demonstrating your
> lack of knowledge on the subject.

lol.

My lack of knowledge, but yet I build and maintain equipment on a daily
basis.

>
> >> If you want to argue semantics any more, maybe you should keep a
> >> reference book handy.
> >
> >
> >I was never one for arguing semantics. Thanks for your admission,
though.
>
> Then why do you keep bringing up all these inaccurate definitions?

YOU are the one disagreeing with me so far. Not the masses.

You are the one that in one thread likes to talk definitions and specifics.

YOU are the one that couldn't figure out that a "Bird Watt" term was
commonly accepted as a measurement of power from an amp that
was measured on a Bird wattmeter, even when others came and said
that it was commonly accepted as a unit of power measurement on
this newsgroup.

See the pattern developing?

You
> can look them up yourself before you post, and that way I wouldn't
> have to set you straight all the time.

So far, you have straightened nothing out, except served to cloud the issues
even more with bullshit arguments over semantics.

>

> >
> >
> >Notice, no answer here. Doesn't fit his argument.
>
> Because it was answered in the following paragraph:

No, you didn't anwer the question posed of you.

Nowhere in the next paragraph does it give ANY indication of
why radar tubes are rated in PEP.... And it REALLY doesn't
make your theories look good, since you seem to think that in
dealing with RADAR, PEP values are arbitrary.

>
> >> > The

> >> >arbitrary,
> >>
> >> Whoa! Where did you get that? I said the same "method" can be used.
> >> And where did I say anything about the value being arbitrary?

Again, if RADAR can, and is measured in PEP, then why is it that PEP numbers
are meaningless then? YOU stated that they where only useful in SSB
measurements.

RADAR isn't ssb.

AVG power output of a RADAR signal may be very low, and the PEP values high.

We have done the same thing with CB amplifiers, and the MB8719 chassis is
EXTREMELY
easy to modify for high pep / low avg readings.

But, if you don't have a PEP reading meter (remember, they are meaningless
for anything other than
ssb measurements, you will never see this. Who do you think would be able
to communicate farther?

The person running 10 watts AVG and 40 watts PEP, or the peron running 10
watts AVG and
1Kw PEP?

Guess when it comes to AM, as well as other services, a PEP reading can be
useful.

IE:

http://www.gsoft.com.au/ionospheric.html

The HF/VHF Ionsopheric Radar System is a unique, broad-band, frequency-agile system. The standard system covers the frequency range from 10 to 60 MHz and is available in transmitter power increments of 8kW Peak Envelope Power (PEP).

http://www.atrad.com.au/products/BR75.html

Peak Envelope Power 7.5 kW PEP (user controllable)

http://w3.jamstec.go.jp/mirai/data/MR99-K04/cruise_report/9904_report_9.pdf

3 places dealing with radar, manufacturing, that rate their equipment in PEP.

They don't know what they are talking about as well?

> >
> >
> >
> >I said:
> > >Please explain to us how that 100 thousand watt PEP number is

statement.
>
> I agreed, but I didn't say it. And how do you equate 'meaningless'
> with 'arbitrary'? Don't you have a dictionary?

If your in agreement, then why do you argue in other places that isn't your stance.

Arbitrary:
Determined by chance, whim, or impulse, and not by necessity, reason, or principle
Based on or subject to individual judgment or preference

Since RADAR manufacturers rate their equipment in PEP, it would appear that your
statements about PEP not being a true unit of measurement in the RADAR arena would
be determined by chance, whim, or impulse, and not by necessity, reason, or principle.

>
> >> > since PEP isn't used or useful in measuring RADAR signals

lol

3 times I have pointed out where you agreed that PEP measurements where
meaningless. Countless times you have said you never agreed, or don't
agree.

Which one is it? You cant agree and disagree.

>
> >> Now put that to a Venn diagram and see what you get.

Have what you want. I have exposed you for what you are. From this point
on,
I refuse to debate a topic with you, as I don't think you are capable of
doing so
without throwing your own twists into it, having problems comprehending what
others are saying and just providing an argument platform for not discussing
the topics, but more for attempting to berate and belittle others for using
commonly accepted terms outside your box.

Have a nice day, though.

If you don't mind buying russian, I have a place where the 4CX800 russian tube is only 65 dollars.

Ceramic / steel tubes are the way to go, only because of the fact that the glass tube supply is
all but gone.

A Texas Star Sweet Sixteen or Messenger 8 pill....

However, I saw the amp at Dennis' the weekend before you came to pick it up, so I know what he did to it.

I liken them to the efficiency of the Real Deal line of amplifeirs.

1 driving 2 driving 3 driving 4 driving 5 add infinitum.

However, they are a decent amplifier for someone who wants to play... Just not the power
mongers that some of the other battle box amplifiers are. Due to the inefficiency, the
transistors aren't pushed as hard,don't dissipate as much, and don't fail as often as
some of the other brands, though...

Couple that in wiht the people who "drive the piss" out of them, and you see a normal failure
rate, however.... Give or take.

>Does a stock 'Out of the Box" radio work well?

Yes, depending on the brand of radio. The Uniden Grant XL (or LT) is a fine example.

>Or......
>should it be peaked tuned for a few extra watts?

Don't bother. I won't bombard you with the legal drivel. You'll get that elsewhere. If you concentrate on improving your antenna system, you'll reap the benefits on transmit AND receive. The extra couple of watts really won't make a discernable difference, 5 or 6 dbd of gain from a good directional (or well designed wire) antenna will.

>Curious if I needed to have
>elaborate tuning to get more than a half mile.

You can literally work the world with 12 watts P.E.P. on sideband. I must advise you that doing so is contrary to FCC rules, but it's a common occurence nevertheless. This is known as DX or "skip." Your signal bounces off the ionosphere to the receiving station. With 4 or 12 watts, ranges of 15 to 20 mi. can be had via straight path. (When it's quiet.)
>Also, a dealer I communicated with said that the CB's he has can get extra
>channels, but only above the CB 40, not below. Is the below 40 channel area
>only available with an export radio? Does anyone know of a CB or dealer that
>can do a CB to include both lower and upper.

It's not really worth it, but it is YOUR choice. I would advise you to definitely confine your transmitting rig to a legal 40 ch. AM/SSB rig. There's nothing wrong however with buying a good 10-meter rig that'll allow you to monitor both 10 and 11-meters as well as allow you to get OTA upon passing your Technician's written exam (35 embarrassingly easy multiple choice questions.) and a very simple 5-wpm Morse code exam. This was my path. Trust me, you'll love it. :-)

>I don't think I want to get into the export radio arena, but wouldn't mind a
>little exra power and the capability to listen to the bands outside of the
>regular 40.

Straight from the horses mouth:

1. Uniden Grant XL (You can find them cheap on ebay.)

2. Uniden HR-2510 (a.k.a. President Lincoln/Listen all you want on 11-meters, but don't transmit. Grab that Tech "plus" ticket and have fun on the 10-meter Novice/Tech+ sub-band while you study for the General exam...another embarrassingly easy 35 multiple choice questions.)

>** I am aware of the legality issues associated with the modifications I
>seek. **

Are you? Are you aware that when you grab that Tech ticket, (35 questions, no code test, and ten bucks.) as a licensed amateur you can buy that 10-meter rig, modify it and listen all you want? (Just do NOT transmit without passing the code test.) Are you also aware that the moment you modify that legal 40 Ch. rig for extra channels, it is no longer type-certified. You can't even use it on the "legal 40"...even if it'still putting out only 4 watts. You may also choose to pick up a VHF &/or UHF rig and use it with that Tech ticket. (Personally, not my bag of chips.) Take the Technician's exam, pass the code, and kick a$$ on both 10 AND 11-meters, legally. The code is pretty easy, you just have to set aside 15 to 20 minutes for practice daily.

>I was only going to use the radio while in Brazil :-)

I've had some "real world" exprerience with rf "practices" in South America. Suffice it to say that they take a much different approach to the relationship between 11-meter and amateur radio. You'd likely encounter little difficulty. But it's easier to steer straight and narrow. That way, you'll DEFINITELY encounter NO difficulty. I hope that helped. Feel free to drop me an e-mail if you have any questions.

Here's the site for free practice exams. The more you practice, the better you'll get. It's a finite pool, so even if you get a zero the first time around...you'll improve each time as you get more and more familiar with the questions.

http://www.qrz.com/testing.html

You can download Morse Academy here.

http://www.ah0a.org/AH0A.html

Best of luck to you.

well let us get down to nutt cutting shall we??? what it is you do
for a living????? and what are your educational credentials???? my
suspicions are this. i think you are on the government payroll, aka,
ssi or something like that. sometime in the past, while you were out
working somewhere, you dropped a hammer on your big toe , so now you
can't 'work' anymore boo hoo hoo. so now you volunteer. you probably
are a fat guy. and ugly as homemade sin, and you haven't had pussy
since pussy had you, and somehow you fell into this 'volunteering'
thing. which is fine with me. if my suspicions are correct, then i
say this. it is easy to volunteer when you got some money coming in
from somewhere, namely good ole uncle sam. i tell you this, somebody
is paying the bill for you to have all of this time
'volunteering'....volunteering is fine..... i, mr. jones, want the
twut, the whole twut and nuttin but da twut....and after mr jones gets
his curiousity satisfied, then and only then will mr jones, shut
up.....and dat's a fact jack.....

and another thing hoseman..where were you last june when my trailer
took off and floated down buffloe bayou....good buddy???? i didn't
see your fat ass out there helpimg me hook up the tow line from that
winch truck in order to pull my trailer containing all my worldly
possessions out of the drink, come on , come on.....

-
Cbers in their wonderful beat the hell up redneck pickup trucks and VHF ship-to-shore boaters outnumber hams by a very large number. Remember Andrew? It was no man's land around Homestead for days..DAYS before ANY official organization came in. By that time, helpful citizens with pickups, winches, water, food, generators and dumps were already well on the way to having things under control.

kc2hmn@cs.comnospam (Bert Craig) wrote:
>Here's the site for free practice ham exams.

Oh man, this is going to make me REALLY unpopular, but what the heck, I gotta say it. I admire Bert and sometimes Dick for presenting the case for ham radio, but I think sometimes it's...well...premature and not always appropriate.

Face it, there are people that just want to buy a radio and gab on it. They don't care about rare DX. They don't care how a Chebyshev filter works. They don't want to experiment with antennas. They just want to BS a bit on the CB. They want a plug and play solution.

They have heard "extra channels" and "power" makes for a better CB. How do you reach these people and motivate them to stay within the law - without pushing them towards ham radio?

Source record: 112509

Legalities aside, if you want more signal, I would NOT go with those 'peak and tune' operations. If you get more watts, I'd want to know what frequencies those extra watts were on. An afterburner (linear), not overdriven, and the radio not overmodulated will give you a clean signal. I guarantee there are a bunch of folk that got burned on a peak and tune (doesn't mean it CAN'T be done, but how much does one expect from a PROPERLY DESIGNED stock rig?). Some might work, others might not, and still others will really bump that power meter - but I would gently remind you that output on 54 MHz (and other frequencies) will add to that power meter reading but not do you a bit of good on 27 MHz. Bert's idea is best - concentrate on the antenna as it will help your receive as well as transmit. Best bet, stock rig with a GOOD antenna (yagi for distance, vertical for local mobil work; cross-polarization between you and a desired station can reduce your signal TWENTY dB). If you want a lot of DX and solid coverage out thousands of miles, go for the ham ticket. The solar cycle is on its' way down, you know. Ooops - big creveat - if you were serious about Brazil, don't DO NOT just do anything without checking their regulations about foreigners using radios in their country. In foreign countries, you will not be dealing with the FCC. Some of those places can be brutal (remember the kid that got whipped in Singapor?). Do not take anyone's advice on international anything. Check the regulations of that country. BTW, a personal friend of mine was going to South America about 15 years ago. His lawyer wanted power of attourney and all of his papers - so he could sell the guy's house and assets if necessary to buy my friend's way out of the country!

It is simple, Aaron. When you peak and tune and remove limiters, the meter goes up. The argument has been about peak vs average and whatever. The real question is where in the spectrum are these 'extra' watts comming from. I'll leave that explaination to you.

The reason I ask is that I'm sure the radios from the factory are detuned to stay well within the guidlines set forth by Uncle Sam.
If a radio can do 25 watts, but sound like heck, fine, I'll take 18 watts. But like the car I drive, I prefer to have the power going up the hill instead of struggling.
Linear amp? Nah, believe it or not, I really want to stay close to legal. I say close because I want a little extra oomph if I can without an external amp.
I really don't want to DX on the bands outside of the 40 and swap cards. I want to listen. If I enjoy it and want to persue it, I'll go ham. I took a practice test for a goof and scored 67 without any study. I know I can get a ticket.
At the moment Aaron is on the mark. I want to goof around and get my feet wet. No echo, beeps, or farts. Just looking for a high quality radio that is optimized for best performance.
I have already bought an antenna (hope I picked a good one). It's a 4 ft. Wilson Silverload that will be mounted on the driver side of a tool chest in the bed of my pickup. I will get about 50% of the whip over the cab. Not perfect, but I hope this setup will suffice.
So, anyway, back to my original post below.....

Oh, and the Brazil thing was a joke. I was trying to save myself from the legality feedback.

Dennis,
It's been something like 40 years since I took a test
for a radar endorsement. I don't think there was a question
about 'CW' radar on the test at that time, but couldn't swear
to it now. Concidering the 'lag' between 'current' technology
and testing, I really doubt if it was covered in 1960-63, even
if 'CW' radar was around then (beats me).
'CW' radar has been around for a while, but I can't tell
you how long, and can't tell you where to find specific
information
about it. I'm sure if you really want to know, you can find it,
though.

Whatever you use make sure it has a good strength to weight ratio.
Most advertised antenna mast pipes have this. If you don't stick to
this ratio and then extend the mast to far the mast weight and antenna
weight will combine and bend when swaying in the breeze.

Hi Jason,

You need to find the route the noise/static takes to get into your radio... ie the power line or the antenna port.

Start the car, remove the antenna from the radio... does the noise drop almost all the way or stop..? If so, you have items in the car and via the motor that radiate to the antenna. If everything stays the same, you need to filter the power line better.

There are no cures for some of the small automotive rf generators. But you can reduce their range. Wide flexible ground straps to from the frame to the body, the body to the hood & trunk lids, the frame to the exhaust pipe system and a few straps to the motor block from the frame.

After that, you pretty much have to go after the source. If you run a semi long line of coax out of the car to a distant/remote antenna and run the engine you'll know if the noise is local to the car. There will even be places in/on the car where it's much louder... ie near the motor.

Try some of these tests and get back to me/us if you still have problems. Ground bonding everything listed above is a good way to get started...

cheers
skipp

I am a journeyman plasterer, drywall finisher. I was injured in a head on collision on november 8th 1991 on my way to work, I sustained neck and back injuries in the accident, and never once did I collect any government money from those injuries. I went to college after the accident, paid for out of MY pocket, I attended Owens Community College, majoring in Mechanical Engineering, and minoring in computer programming. I have had several jobs since then and never once collected any government money, I managed a group home for people with psych problems, I orked as a chef at some local establishments, and I got tired of people telling me what to do so I started my own business. I am my own boss now, and that makes me enough money to live on, and enough time to do what I enjoy doing, my radio hobby, my music hobby, and helping people. Oh I have also served as both payed and volunteer fireman/paramedic. Last June I was in Houston Tx helping with the disaster relief from the 32 inches of rain that caused all the flooding there, 4 days after I got home from Houston I was driving the ERV (Emergency Response Vehicle) from Toledo Oh, to Beckley WV, to spend another month there helping out. Had I not been there I would have gladly came to your assistance.

You want to know why I do these things? 2 years ago I had 8 ft of water in my own yard, people came and helped me out, and now I am repaying them by helping others.

OK DOC!

I did the research as you suggested; and here's what I found on CW RADAR:

Principle of Operation

As opposed to pulsed radar systems, continuous wave (CW) radar systems emit electromagnetic radiation at all times. Conventional CW radar cannot measure range because there is no basis for the measurement of the time delay. Recall that the basic radar system created pulses and used the time interval between transmission and reception to determine the target's range. If the energy is transmitted continuously then this will not be possible.

CW radar can measure the instantaneous rate-of-change in the target's range. This is accomplished by a direct measurement of the Doppler shift of the returned signal. The Doppler shift is a change in the frequency of the electromagnetic wave caused by motion of the transmitter, target or both. For example, if the transmitter is moving, the wavelength is reduced by a fraction proportional to the speed it is moving in the direction of propagation. Since the speed of propagation is a constant, the frequency must increase as the wavelength shortens. The net result is an upwards shift in the transmitted frequency, called the Doppler shift.

Sure sounds like DOPPLER to me!

Why did you say NO IT WASN'T?

Regards,

Dennis O.

I think you make two points that pretty well sum things up.

1. That there is headroom for the asking from stock radios. Some, of course, just on production variance -- a lot? not enough to make a lot of diff. So Red down at Happy Joe's Truck Stop, Funeral Parlor, and Emporium of CB Delights gets meter readings the easy way: disable the harmonic traps (every amp produces some) which is totally useless and potentially dangerous to your finals as well, but adds to output and cuts the modulation limiter which not only produces buckshot - also adding to the meter reading - but cuts your 'talk power' in half the better to sell you

a footwarmer and a power mike. It is a lot better not to volunteer for firing squads without being really sure which side you are volunteering for.

2. The village idiot can pass the Codeless Tech. More precisely the village idiot's wife. I get rocks thrown at me regularly but selling the CT as an entry to Amateur radio is a fraud right up there with Happy Joe's. You will also find Element 3 is not that hard and the code test simply takes time and a bit of effort.

Enjoy! Just keep a hand on your wallet.

PROFESSOR: Hi.

HOST (N8): And last but not least, that nattering nabob, TNOM!

TNOM: I resent that.

HOST (N8): OK, Let's play BATTLE OF THE CB TECHS! Dennis, you've got the spin.

(DENNIS SPINS THE WHEEL)

HOST (N8): The category is....COAX LENGTH for $50!

DENNIS: Yay!

HOST (N8): Here's the question. Does coax length lower SWR?

PROFESSOR: Yes! It does! But only if you're running my Skywave amp!

HOST (N8): Ohhh Sorry. Wrong answer. Dennis?

This is a lot more exciting than a keydown. All the NG regulars locked in mortal combat to see who's reputation as a "tech" gets trashed and who comes out on top. I wonder if people would pay money to see this? It could be a new game show.....

HOST (N8): Hello and welcome to another episode of BATTLE OF THE CB TECHS! Let's meet our contestants! Hailing from the windy city, we have DENNIS O!

DENNIS: Hello Doug.

HOST (N8): Next, from somewhere in cyberspace, THE PROFESSOR!

PROFESSOR: Hi.

HOST (N8): And last but not least, that nattering nabob, TOLL FREE!

TOLL: I resent that.

HOST (N8): OK, Let's play BATTLE OF THE CB TECHS! Dennis, you've got the spin.

(DENNIS SPINS THE WHEEL)

HOST (N8): The category is....COAX LENGTH for $50!

DENNIS: Yay!

HOST (N8): Here's the question. Does coax length lower SWR?

PROFESSOR: Yes! It does! But only if you're running my Skywave amp!

HOST (N8): Ohhh Sorry. Wrong answer. Dennis?

DENNIS: No. In my Xforce amp designs the SWR is preset at 1:1.

HOST (N8): Sorry Dennis, wrong. Toll?

TOLL: If you use Bird Watts it does.

HOST (N8): Owwww too bad, wrong, Toll.

TOLL: You twisted my answer.

HOST (N8): Well we're out of time so join us next time when...

TOLL: I know about radar.

HOST (N8): ...we play BATTLE OF THE CB TECHS!

When you get the dipole built, you will find two things: you have to cut it short to get the SWR anywhere near decent, and 2, it will be as broad as a city bus and you will read somewhere - correctly - that broad antennas are not efficient radiators. Here's why:

The input impedence of the Universe is 377 ohms. It often comes as a big shock to SWR fiends that their matched antenna has an 8:1 mismatch to the Universe. Not a big deal, there will be a large magnetic near field near the feedpoint of the dipole and one hell of a static field toward the tips. The Mag field couples to every nail, electric wire, and used paper clip in the vicinity. The coupling to these items forms a resistive load in parallel with the antenna and gives you about a 20 ohm input impedence if you are lucky and that is a 2.5 SWR. And nothing in this world is broader than a resistor.

Look up 'folded' dipole which cuts the mag field down substantially and raises the input impedence to something your radio will not throw up at. Or better yet, take 36 feet of wire and hang it on a wall. Yes it will be

about 7.5x10.5 rectangular but do it anyway. Feed it at a corner. A lot of things work better indoors than dipoles; nothing, however, will substitute for getting it out into freer space.

Knock this down, tnom:

It seems that you have no argument that, for a sine wave, voltage and
current are:

rms = 0.707 * peak, and
avg = 0.636 * peak.

Now we already know that 'effective' (or 'rms') power is equivalent to
rms voltage times rms current. Likewise, when you multiply the average

values of voltage and current, you will get a value representing just that, which isn't useful for very much. With me so far? Ok...,

It seems to be common practice among the uninitiated to refer to "effective power averaged over time" as "average power". Hence the quote I provided.

RMS is a function of a sine wave, as it usually encountered with RF. RMS is a great way to measure the 'effective' power of a radio signal. The only problem with that is that voice audio is rarely a sine wave. RMS for a non-sinusoidal signal isn't the same value as for a sine. Another method is needed to measure modulated RF. I haven't lost you yet, have I?

The audio component of the RF signal varies quite a bit, and at any one time may be adding or subracting from the effective power. But when the effective power is averaged over a length of time, the audio component 'averages out' of the measurement. Enter the 'averaging' power meter, which, instead of reading power at a particular point in time, reads power 'averaged' over a length of time.

So when reading a modulated AM signal with an averaging meter, the measurement will remain steady. This is not "average power", nor is it "effective power". It is power that has been "averaged" over a given length of time. Lost yet?

Now you might have deduced that the meter should continue to read 'averaged' power after the signal stops because of the time needed to 'average' the values -- the signal will be present for part of the time and absent for the remainder. Still with me?

This is in fact exactly what happens. You might not notice the effect because that time factor is relatively quick compared to the response of a meter, as well as the human eye, but if you measure the dc voltage on the meter with an oscilliscope you will observe a gradual drop in meter voltage when compared to the RF input. This happens because of the 'averaging' nature of the meter's 'averaging' circuit.

"Whoa!" you might say, "How can there be power when there is no power?" Quite right, there isn't. An "average" is a mathematical function, not a physical value. It looks something like this:

Pavg = (P1 + P2 + P3 + ... + Pn) / n

...and since it happens that the meter continues to measure this "averaged power" for a few milliseconds after the input power stops, it necessarily follows that "averaged power" DOESN'T look like THIS:

Pavg = Vrms * Irms

I thank you, tnom, for reiterating to me the importance of semantics.

A question - the radios have to be tested to assure meeting FCC requirements. OK. Other than that, why would any engineer spend extra money putting in components that could allow a clean signal at 20 or 30 watts? That would cost money and they would be fired (if not shot at high noon). Now, assuming the radio works properly (it should, you should see the reports that are turned into the FCC for type acceptance), why should it work better by clipping out components? Oooops .. that's two questions.

I wouldn't trust it. Even connectors start getting funky at 400 MHz. UHF connectors start getting (slightly) lossy. I doubt many SWR meters designed for 30 MHz could be trusted. They might even add losses to the system. Granted, 800 MHz is a good deal higher than 400 MHz, but I got caught once trying to tune a trunking radio up. I couldn't get more than 6 watts into the dummy load. Well, I had adapters - a UHF connector to N. I replaced the thing with all N connectors and presto - 14 watts to the dummy load. Now if just a connector can do this, what will a meter, rated at 27 MHz, do to 450 MHz?

Thanks for the info so far. If I use a choke at the base of the antenna, will that prevent what is called rf? If that will take care of the rf, then the additional ground rod for grounding the coax is still needed?

At this point, I am thinking of only grounding the mast because Im not sure how to ground the cable or shack. Also, more connectors will give me more loss, and im not sure how much more protection.

Connect a clamp to the base of the mast, right below the antenna feed, make 6-8 coils in the good coax and then feed it into my radio. The coax going into the radio is on the second floor (antenna on chimney with a straight chase into my radio of about 20 ft) so if I ground the coax, which im not sure how to do, the coax would need to either have a big hanging loop in it so It is near the ground and by the mast ground rod, or be somehow grounded with another ground rod.

Darsh-this is getting more complicated. More help-please.

TIA
Jason

Hello Toll Free: I really loved the days you could retube a amp, just because you wanted to. I remember 3 or 4 dollars each for the 6LQ6 or 6JE6 tubes. My cusin use to get production lots from his TV shop, by the case.

Yeah Ceramic is the way to go, the linear amplifiers last a life time.

Freaky Freq.:
I have a few left of these units brand new in the box, from 1977. I sold an almost NOS one a year or 2 ago for around $400 or so. My brand new ones will probably go for more. NOW is NOT the time to sell it. NO ONE is buying anything much now on E bay--it is DEAD. The 9-11 and economic DEPRESSION we are in has lowered the price on a lot of antiques on e bay and it is best to hold on it it for more $$$ later!
Dave!!!!!!!!!!!!

> Just curious.

There actually was an antenna that was pretty close to 377 across its length but it was very long relative to a dipole and had so many high-voltage caps in refrigerator jars it was a mechanical nitemare to build strong enough to hold itself up. Reputedly worked well, however.

As long as it is in 'free space' meaning in this case it doesn't couple to anything, no big deal. At lower freqs this is difficult to do unless you have access to the Goodyear blimps for support

A folded dipole can be thought of as either a degenerate loop or a double dipole. In either case, it divides the current in half and therefore cuts the mag field in half. As the voltages are also split the input impedence becomes four times that of a comparable dipole. That it comes close to a theoretical 300 ohms, and at VHF pretty much an actual 300 ohms which is why a lot of TV antennas used folded dipoles and 300 ohm ribbon. Back in the Stone Age, there were folded tripoles and 600 ohm open line. You often see folded unipoles, particularly at UHF because the bandwidth is broader and they can be run at DC ground which the electrical codes definitely prefer. A higher resonant input impedence generally helps bandwidth; a lot of beam designs have to be made non-optimum to get the impedence up to 20 ohms and get some bandwidth.

The purpose of using a folded dipole or loop indoors is simply to raise the input impedence to something manageable by the transceiver and keep the heating of roofing nails to a gentle, ladylike belch. I make the 377 statement only to get across the idea that one hell of a magfield exists even at fairly low power level and that it may exist several wavelengths from the antenna.

On any dipole, conductor diameter etc have an effect -- more of one as freq rises -- and any time a second element can be a parasite there will

be effects but they tend to fade into insignificance as freq goes lower.

Wherever coupling can be a problem it is a good idea to go to loops etc.
Where there is nothing to couple to, BFD.

I remember reading somewhere about the input impedance of a folded
dipole as being a function of the diameter and spacing of the
elements. But even if it could be built for 377 ohms, why would that
make any difference in performance?

Just curious.

>length of time. Lost yet?

Yes it remains steady because of the way a average reading
voltmeter works. But an average reading voltmeter is flawed when
it is used to read watts. That is why it can not be calibrated to
read wattage accurately with a non constant sine wave, but can be
calibrated accurately with a constant sine wave.

>Pavg = Vrms * Irms

Pavg = Vrms * Irms can hardly be used in a randomly modulated signal.

It can be used for a constant tone and as a PEP formula of a sine wave
modulated AM signal as long as your sample is properly placed.

2330. expected power "draw" of a Turbo-Tuned Galaxy CB radio (non-externally-amplified)???

Newsgroup: rec.radio.cb
Date: 2002-01-18 03:25:02 UTC
From: jabb3rw0cky@netscape.net
Message-ID: <8354e2f6.0201171925.4c212f34@posting.google.com>
Source record: 112567

if i'm running a (for example) Turbo Tuned Galaxy brand CB radio off 110 VAC, what kind of power draw can i expect to experience from my power supply?

i've read that some professional amateur rigs on 2m and 70cm will require about 30A from a power supply when transmitting at full power (anywhere from 30-50 watts).

should i expect a heavy draw from a "tuned" CB radio?

> village idiot's wife. I get rocks thrown at me regularly but selling the
> CT as an entry to Amateur radio is a fraud right up there with Happy
> Joe's.

Right, the CT is a total failure as an intro to the wonderful world of
ham radio. VHF is boring to the newcomer seeking HF thrills.

> You will also find Element 3 is not that hard and the code test
> simply takes time and a bit of effort.

For them's that's truly interested in radio the effort is nil. The
others need something more to keep them off the streets. Maybe 20
year jail terms for "CB techs" caught practicing their "craft".

I propose a radical solution: make ham radio cooler than being a
keyclown.

1. Bring back the Novice license (with distinctive callsign prefixes,
WN/KN/AN).

2. Give them 10-meter 'all-mode' privileges in a shared sub-band (like
28.3 -28.4).

3. Flood the market with new 10M projects and products (xcvr kits,
digital, SSTV, PSK, products, innovative antenna designs, etc).

4. Create contests, DXpeditions, nets, special events, etc. to make
the 10 meter sub-band THE place to be.

2332. Cheap Deal on CB Books

Newsgroup: rec.radio.cb
Date: 2002-01-18 03:51:25 UTC
From: lou@cbcintl.com
Message-ID: <667f4ukanejpaio6afo4u6cmnmltgbbke7@4ax.com>
Source record: 112569

To learn the TRUTH about CB Radio without all the hype and the people who are just plain misinformed, you should check out the following books. They are selling right now at a big discount too.

You can see exactly what these books look like, plus all the specific, chapter-by-chapter details at:

www.cbcintl.com

The books included are:

BOOK #1: THE "SCREWDRIVER EXPERT'S" GUIDE To Peaking Out & Repairing CB Radios. List $22. The most popular "big dummy's" guide ever published on do-it-yourself CB repairs & modifications. Covers peaking of receivers, transmitters, modulation, mike problems, antenna & SWR problems, detailed frequency modifications for both crystal & PLL radios. Loaded with charts, illustrations, and specific instructions for most brands including the new export models. This latest edition also covers slider and broadbanding tricks, FM conversions, and much more!

BOOK #2: THE CB PLL DATA BOOK. List $20. The only complete reference source on CB PLL synthesizer circuits ever published! Detailed PLL theory explained in layman's terms. How they work, and how to modify them for many more channels. Includes specific PLL block mixing diagrams, truth charts, & IC pin function diagrams for nearly every PLL chip ever used. Covers all the most popular U.S. & export chassis, with specific listings of all models using the chip.

BOOK #3: UNDERSTANDING & REPAIRING CB RADIOS. List $38. Giant 370-page technical book for the professional repairman. Picks up where the "SCREWDRIVER EXPERT'S" GUIDE leaves off. Includes circuit descriptions & troubleshooting guide for 23- & 40-Ch., crystal & PLL, solid-state & tube, AM, FM, SSB, CW, American & export models. Covers test equipment (& where to find it), transistor basics, synthesizers, receivers, transmitters, power supplies, T/R switching, antennas, interference, parts & accessory sources. Over 350 illustrations including schematics, charts, and photos. Huge subject index also lets you look up repairs by symptoms. This is "must" reading for any serious CB technician!

$$$$$ EVEN BIGGER DISCOUNT! $$$$$
We offer this 3-book combo a couple times per month on EBAY. You can often get it for as little as ONE-HALF the $80 retail price. Check it out!

never owned one of those, and I may be wrong, but I have heard several
people tell me that the saturn turbos when "tuned" used to go through alot
of power supplies.

You are being a little too vague here.....We'd need to know a model you are interested in to give a decent answer. There are some very low power radios and some very HIGH power radios to choose from and knowing the one you are talking about would be a great help in answering your question.
PS.....Skip the "Turbo Tune" and have the radio done right!

To get all tangled in hype and people who are just plain misinformed, you should check out the following books. We are selling turbo tune ups right now at a big discount too.

You can see exactly what these books look like, plus all the specific, chapter-by-chapter details at:

www.KEYCLOWNS-R-US.com

The books included are:

BOOK #1: THE "SCREWUP EXPERT'S" GUIDE To Peaking Out & Destroying CB Radios. List $22. Sale Price $345.00.
Most popular with "big dummy's" and do-it-yourselfers. Covers peaking of SWRS, transmitting with a dead fish, modulating a canteloupe, problems with guys named Train, ignoring antenna & SWR problems, detailed frequency modifications for both police & aircraft bands. Loaded with BS, heresay, and vague instructions for almost no brands including fake ham radios and export models. This latest edition also covers jail terms, hijacking airliners, mail fraud, Hebrew conversions, and much more!

BOOK #2: UNDERSTANDING BIRD WATTS. List $38. Noe FREE. Giant 370-page technical book written by a fake technician, TOLL. Picks up where the "SCREWUP EXPERT'S" GUIDE leaves off. Includes wild rantings, crying, accusations, babyish whining, and more. Over 350 illustrations in crayola crayon including totally irrelevant schematics, charts, and photos. Huge subject index also lets you treat symptoms of nausea (needed if you read this book). This is "must" reading for any keyclown wishing to use the latest lingo!

>A few milliseconds.....Knit picking are we?

A lot of RF can happen in a few milliseconds. Regardless, it's not the length of time that matters in that argument, it's the fact that the meter reads power AT ALL when none exists. When that happens, both Vrms and Irms = 0, while Pavg <> 0. Therefore Vrms * Irms <> Pavg.

Case closed.

Bird is very well aware of the limitations of their meters. After all, they designed them.

There is a Bird publication that discusses the effects of various waveforms on their various meter designs. It may be available for reading on their web page. Unfortunately, I cannot find my copy of the publication right now.

> Yup. ARRL manual gives misinformation all the time, doesn't it?

If it made that suggestion, it certainly does. Look at it this way,
if it worked, then commercial stations would be using steel wool. It
is trivial to seal the assembly to keep it from rusting. Since they
don't, there must be another reason.

> 1 to 2 inch pipe?
> For correct decoupling, you need it wrapped around more like a coffee can.

Either would work, although the pipe does not gain you much. The problem
with small diameter pipe is how tightly you have to wind the coax. That
stresses it more than is desired, and can cause the center conductor to
migrate toward the shield - messing up the impedance of the coax.

> the additional ground rod for grounding the coax is still needed?

There are two reasons for eliminating rf currents on the outside of the coax. One, if there are currents, then the coax is radiating a signal. Two, if those currents get into the shack, they can cause problems with your rig - or cause you to suffer a case of "rf bite".

> At this point, I am thinking of only grounding the mast because Im not sure
> how to ground the cable or shack. Also, more connectors will give me more
> loss, and im not sure how much more protection.

Most people don't ground the coax, because they don't have a proper ground window at the shack. No, I am not going to explain how to make a ground window. Go to the Polyphasor site and read the information there if you are interested.

In many commercial installations, of which I have done my share, the coax is grounded at multiple points. The shield is stripped off so that a ground lead can be attached. This is usually done at least near the antenna, at the base of the tower/mast and at the point where the coax enters the building.

You don't need any more connectors, unless you use a ground window.

> Connect a clamp to the base of the mast, right below the antenna feed, make

> with another ground rod.

The usual place to put a coax choke is right below the antenna. Sometimes one is also placed just before the coax enters the building. I won't go into an explanation of the two ways coax can develop rf currents on the outside of the coax.

They are not detuned. They are not designed to produce more than the
legal power level. Why put in extra expensive parts, when most people
will not have their radios "peaked"?

I wouldn't say that. It increases to about 300 ohms - or a 6:1 SWR. Of course, inside a building and against a wall for the full length, anything is possible.

Reputedly is the correct word. Test by others show that the losses in
the caps make the antenna rather poor.

> On any dipole, conductor diameter etc have an effect -- more of one as

True, but the changes have to be very large. Small differences in diameter
can be neglected.

He said he has a Big-stick and is looking for inexpensive options that
will work well. That's what I gave him. You were looking for reasons
to nitpick my posts but didn't find any. But that didn't stop you from
whining anyway. Go back to playing with your RFI beacons and leave the
legitimate technical advice to the experts.

SSB stands for Single-SideBand, which is a type of modulation that works much better than AM (Amplitude Modulation). The benefit is better range, clearer audio, lower noise, more channels, and no fading. The radios are more expensive, but the crowd is usually a bit more civilized. You do not need to buy a different antenna, but you might want a good-quality mic because of the better audio quality using SSB. I highly recommend SSB over AM.

Probably should have but I didn't remember Cebik having anything to say on the subject. Glad to see we pretty much agree; it is a dipole with a 4:1 impedence shift that sucks swampwater on second harmonics. Yup.

Thanks for the reference.

A travelling wave has both a static and magnetic component -- just think of it as that which makes your hair stand up. In earthbound situations we use the magnetic field a lot more in motors and antennas but there is such a thing as a electrostatic motor that would work gangbusterly in say deep space. As a practical matter, just remember that tips are voltage nodes so when loading your gutters expect any dog taking a whiz to get the thrill of his life.

It is in fact the relation of the static and magnetic fields that defines the 377 ohm impedence of the Universe.

SSB does indeed stand for Single-Sideband. It is actually Suppressed Carrier Single Sideband. An AM signal is normally comprised of a carrier frequency, and two sidebands. In SSB modulation, the carrier is suppressed, resulting in the ability to transmit audio on either of the two sidebands. This uses less bandwidth to transmit the signal and reduces the amount of interference to stations on adjacent frequencies. Sideband signals are, however more difficult to tune in because of the reduced bandwidth and the absence of a carrier.

SSB signals DO fade. Anyone who's tried to copy a rare DX station and have the band die just as the pileup is thinning out can attest to that.

The audio quality may be a matter of personal opinion, but monitoring both SSB and AM audio, I'd have to say that on a radio capable of producing both types of signals, typically the audio on the AM signal will wound richer, fuller, and warmer. It's just a matter of having more than twice the bandwidth in which to transmit the signal.

The main advantages of SSB are greater range, and less bandwidth requirements (meaning more intelligible signals can be carried within a given frequency range, or band). SSB signals are favored among amateur operators for voice transmissions because of these reasons.

Why not use some type of insulating material around the steel wool.

I had read that into the article, just on common sense.

A choke isn't varied from design standpoint by the turns to diameter ratio?

When you halve the diameter of the turns on a choke, it doesn't change its
properties?

Hello Dick: I believe Eimac has produced the 4X150 since the late 40's to early 50's.

The sweep tube Linear Amplifiers, where a great idea using basically TV parts and some inexpensive tuning capacitors and a relay. That were available in quantities of the Gazillions and then some.

The sweep tube amps started out with one tube, then two, and so on. The tube could easily be driven by a low power CB Radio, and when you got more watts out, as compared to watts going in, this was a real kick!

The big problem is that the CB Market wanted everything to be cheaply made to keep the price down. And everyone paid dearly for this. When I was a teenager I could repair amps, and such. Many would catch fire and blow up, just after being repaired. Mostly the power supply's were poorly designed. I have seen a few of the cheap shit goof ball amps out there. One new one called a Galaxy is the cheapest pile of Monkey shit known to man kind. It is designed to fail, catch fire, stop working, and just be a pain in the a$$. No dought imported from a communist country, that wants to sell tubes, transformers, diodes, filter capacitors, tube sockets, and fire extinguishers.

After fixing and repairing these things, I noticed that the ham linear amplifiers didn't go into repair 5 or 6 times a year, and costing 250 dollars a whack to fix!

The old guy (Mountain Man) down the road has a Icom 746 adjusted at half the output power, and uses a Commander 2500, that has two each 3CX800's in the amplifier. I believe the amp is close to 10 years old, and has never needed a repair. So the moral of this story is, that if you want to play, ya gotta pay.
I think the Commander 2500 sold for some where near 3 grand, surly after the shipping costs, ect. But out of almost 10 years no repair bills, no catching fire, no internally shorting and making the noise a direct lightening strike.
So 10 years times no repairs = great! Well worth the price of admission.

That cetainly beats 300 dollars price, and 10 years worh of repairs and fire extinguishers

I have a few of the older sweep tube amps, setting on the shelve in all their glory, collecting dust!

Now that the sweep tubes are going away, and more and more guys are using ham rigs, the ham amps will be bought and used. This is a good thing because the guys will listen in on the ham bands and more then likely get their ham lic.

What does that have to do with a sweep tube amp?

Yes, ceramics have been around that long.

The 4-250 isn't a ceramic tube, either. None of the 4- tubes are. You have to have the C designator in their.

You described a glass sealed tube.

Can you imagine the mental anguish, the psychic trauma,
the 'wailing at the wall' that you've caused for all the
'Bird-Watt' people out there? Ought to be ashamed of your
selves... BUT! Probably boosted 'Dosey' sales by an order
of magnitude (LOL)

Je vois autant de watts sur mon m'etre, monsieur. now alors, je ne sais(connais) pas ce que vous voulez dire, quand vous dites que je ne peux pas voir 20,000 watts sur mon m'etre, le gran type.

Yes you are correct, one does not need to be part of any organization to be
of great assistance in times of need. But it does help to have the backing
and organizational support, logistical support of an established
organization.
In NYC we were blessed with thousands of local volunteers who freely gave
their time in the relief effort, without them my job and those of many other
ARC trained volunteers would have been alot harder.

I was there for Andrew, I saw first hand the actions of the people you
mentioned, and they were of great value.

Anti-Chatter.

Is this anything like a small cap to keep the relay closed?

Or another spin on "Auto SSB" features in some of the other amps?

If he wants to battle weed, hes gonna need more than a 3000.... More than a pair of them.

Try a 6000, minimum, and a HELL of an antenna to battle with them.

Hello my friend. Shoot me your email address... You don't watch the other one anymore. tollfree@bigradios.com

I might be settin the beam back up here on the TJ Border.

I got Ranger's old beam. A 6 element.

Think you can hear this 4CX5000 into that 6 element :)

And having been one of those critics, if you can come up with a decent
unit that is calm and quiet but does the job, I will lead the cheering.
There are enough bozos building 'competition' splatterboxes to fill a
troopship now so something relatively sane is welcome.

I will, however, insist on figures with a good LPF in line.

> gasped and felt for his napkin and fanned the air about him. He had just
> started to feel better, when another urge came on. This one sounded like a
> diesel engine revving, and smelled worse. He tried flapping his arms, to
> clear the air. But another one snuck out, and the windows rattled, the
> dishes on the table shook, and a minute later, the flowers on the table
> were dead.
>
> When he heard his wife ending her conversation, he neatly laid his napkin
> on his lap and folded his hands on top of it. He was the picture of
> innocence when she walked in.
>
> Apologizing for taking so long, she asked if he had peeked at the dinner.
> He assured her he had not, so she removed the blindfold and yelled,
> "Surprise!!!"
>
> To his shock and horror, there were twelve dinner guests seated around the
> table for his surprise birthday party.

IMMIGRANTS, NOT AMERICANS, MUST ADAPT

I am tired of this nation worrying about whether we are offending some individual or their culture. Since the terrorist attacks on Sept. 11, we have experienced a surge in patriotism by the majority of Americans. However, the dust from the attacks had barely settled when the "politically correct" crowd began complaining about the possibility that our patriotism was offending others. I am not against immigration, nor do I hold a grudge against anyone who is seeking a better life by coming to America. Our population is almost entirely composed of descendants of immigrants. However, there are a few things that those who have recently come to our country, and apparently some born here, need to understand. This idea of America being a multicultural community has served only to dilute our sovereignty and our national identity. As Americans, we have our own culture, our own society, our own language and our own lifestyle.
This culture has been developed over centuries of struggles, trials, and victories by millions of men and women who have sought freedom. We speak ENGLISH, not Spanish, Arabic, Chinese, Japanese, Russian, or any other language. Therefore, if you wish to become part of our society, learn the language! "In God We Trust" is our national motto. This is not some Christian, right wing, political slogan. We adopted this motto because Christian men and women, on Christian principles, founded this nation, and this is clearly documented. It is certainly appropriate to display it on the walls of our schools. If God offends you, then I suggest you consider another part of the world as your new home, because God is part of our culture. If Stars and Stripes offend you, or you don't like Uncle Sam, then you should seriously consider a move to another part of this planet. We are happy with our culture and have no desire to change, and we really don't care how you did things where you came from. This is OUR COUNTRY, our land, and our lifestyle.
Our First Amendment gives every citizen the right to express his opinion and we will allow you every opportunity to do so. But, once you are done complaining, whining, and griping about our flag, our pledge, our national motto, or our way of life, I highly encourage you to take advantage of one other great American freedom, THE RIGHT TO LEAVE. Please pass this along if you agree

A blonde heard that milk baths would make you beautiful. She left a
note for milkman to leave 15 gallons of milk. When the milkman read
the note he felt there must be a mistake. He thought she probably meant
1.5 gallons, so he knocked on the door to clarify the point. The blonde came
to the door and the milkman said, "I found your
note to leave 15 gallons of milk. Did you mean 15 gallons or 1.5
gallons?" The blonde said, "I want 15 gallons. I'm going to fill my bathtub
up
with milk and take a milk bath." The milkman asked, "Pasteurized?" The blonde
said, "No, just up to my tits.

Old People Football

An old man and his wife have gone to bed. After laying there a few minutes the old man farts and says, "Seven Points."

His wife rolls over and says, "What in the world was that?"

The old man replied, "It's fart football."

A few minutes later the wife lets one go and says, "Touchdown, tie score."

After about five minutes the old man farts again and says, "Touchdown, I'm ahead 14 to 7."

Not to be out done the wife rips another one and says, "Touchdown, tie score."

Five seconds go by and she lets out a squeaker and says, "Field goal, I lead

17 to 14."

Now the pressures on and the old man refuses to get beat by a woman, so he strains real hard but to no avail. Realizing a defeat is totally unacceptable he gives it everything he has but instead of farting he shits the bed.

The wife looks and says, "What the hell was that?"

The old man replied, "Half-time, switch sides."

<< Dave walks into the bar and sees his friend Jerry huddled at the bar, depressed. Dave walks over and asks Jerry what's wrong.

"Well," replies Jerry, "You know that beautiful girl at work that I wanted to ask out, but I got an erection every time I saw her?" "Yes," replies Dave with a smile.

"Well," says Jerry, straightening up, "I finally mustered up the courage to ask her out, and she agreed."

"That's great!" says Dave, "when are you going out?"

"I went to meet her this evening," continues Jerry, "but I was worried I'd get an erection again. So I got some duct tape and taped my pecker to my leg, so if I did, it wouldn't show."

"Sensible" says Dave.

"So I get to her door," says Jerry, "and I rang her doorbell.

She answered it in the sheerest, tiniest dress you ever saw."

"And what happened then?"

Jerry huddles over the bar again. "I kicked her in the face."

TWAS THE MONTH AFTER CHRISTMAS

'Twas the month after Christmas, and all through the house
Nothing would fit me, not even a blouse.
The cookies I'd nibbled, the eggnog I'd taste
at the holiday parties, had gone to my waist.
When I got on the scales there arose such a number!
When I walked to the store (less a walk than a lumber).

I'd remember the marvelous meals I'd prepared;
The gravies and sauces and beef nicely rare,
The wine and the rum balls, the bread and the cheese
And the way I'd never said, "No thank you, please."

As I dressed myself in my husband's old shirt
And prepared once again to do battle with dirt
I said to myself, as only I can
"You can't spend a winter disguised as a man!"

So-away with the last of the sour cream dip,
Get rid of the fruit cake, every cracker and chip
Every last bit of food that I like must be banished "
Till all the additional ounces have vanished.

I won't have a cookie-not even a lick.
I'll want only to chew on a long celery stick.
I won't have hot biscuits, or corn bread, or pie,
I'll munch on a carrot and quietly cry.

I'm hungry, I'm lonesome, and life is a bore --
But isn't that what January is for?
Unable to giggle, no longer a riot.
Happy New Year to all and to all a good diet!

He who knows not and knows not he knows not,is a fool Shun him
He who knows not and knows he knows not,is simple Teach him
He who knows and knows not he knows,is asleep Awaken him

Subject: Three brothers

An Irishman walks into a bar in Dublin, orders three pints of Guinness and
sits in the back of the room, drinking a sip out of each one in turn. When he
finishes them, he comes back to the bar and orders three more. The bartender
approaches and tells him, "You know, a pint goes flat after I draw it,
would taste better if you bought one at a time. "The Irishman replies, "Well
, you see, I have two brothers. One is in America, the other is in Australia
and I'm in Dublin. When we all left home, we promised that we'd drink this
way to remember the days we drank together. So I drink one for each o'me
brothers and one for me self. The bartender admits that this is a nice custom
and leaves it there. The Irishman becomes a regular in the bar, and always
drinks the same way: He orders three pints and drinks them in turn. One day
he comes in and orders two pints. All the other regulars take notice and fall
silent. When he comes back to the bar for the second round, the
bartender says, "I don't want to intrude on your grief, but I wanted to
offer my condolences
on your loss." The Irishman looks quite puzzled for a moment, then a
light dawns and he laughs. "Oh, no, everybody's just fine," He explains, "It
's just that me wife had us join that Baptist Church and I had to quit
drinking.
Hasn't affected me brothers though."

A high school English teacher reminds her class of tomorrow's final exam.

"Now class, I won't tolerate any excuses for you not being there tomorrow. I might consider a nuclear attack or a serious personal injury or illness, or a death in your immediate family - but that's it, no other excuses whatsoever."

A smart-ass guy in the back of the room raises his hand and asks, "What would you say if tomorrow I said I was suffering from complete and utter sexual exhaustion?"

The entire class does its best to stifle their laughter and snickering. When silence is restored, the teacher smiles sympathetically at the student, shakes her head, and sweetly says, "Well, I guess you'd have to write the exam with your other hand."

HAM RADIO IN SPACE: NEW ANTENNAS INSTALLED ON THE ISS

An American astronaut and a Russian cosmonaut ventured into space on Monday January 14th to move a construction crane and install a new set of ham radio antennas on the International Space Station. Roy Neal, K6DUE, has the details.

--

THERE IT WAS, ON NASA TELEVISION, TWO WHITE SPACE SUITED CHARACTERS, DWARFED BY THE IMMENSITY OF THE INTERNATIONAL SPACE STATION. FOR THE 32ND TIME ASTRONAUTS AND COSMONAUTS WERE OUTSIDE THE HUGE SPACECRAFT TO ASSEMBLE HARDWARE.

THEIR PRIMARY OBJECTIVE WAS TO MOVE A BIG CARGO CRANE FROM ITS TEMPORARY BERTH ON THE UNITED STATES SIDE OF THE ORBITING OUTPOST TO A PERMANENT LOCATION OUTSIDE THE DOCKING COMPARTMENT OF THE RUSSIAN CONTROL MODULE.

THAT ACCOMPLISHED, THEY WENT ON TO UNFURL A HAM RADIO ANTENNA. ASTRONAUT CARL WALTZ, KC5TIE AND COSMONAUT YURI ONUFRIENKO, RK3DUO, DEPLOYED THE RIBBON OF TAPE THAT SOON WILL BE IN USE ON A HAM RADIO STATION IN THE SERVICE MODULE,. WHERE THE CREWS LIVE AND SLEEP. A SECOND STATION HAS BEEN IN SERVICE FOR SOME TIME INSIDE THE SO CALLED FUNCTIONAL CARGO BLOCK, ANOTHER SECTION OF THE I S S.

FRANK BAUER, KA3HDO, THE CHAIRMAN OF ARISS, THE GROUP THAT IS RESPONSIBLE FOR AMATEUR RADIO ON THE SPACE STATION, CONGRATULATED THE INTERNATIONAL TEAM OF LICENSED HAMS FOR THE SUCCESSFUL CONCLUSION TO MONTHS OF HARD WORK.

ON JANUARY 25th ONUFRIENKO IS SCHEDULED TO GO OUTSIDE AGAIN, WITH FLIGHT ENGINEER DAN BURSCH, KD5PNU, TO INSTALL 3 MORE HAM RADIO ANTENNAS OUTSIDE THE MODULE THEY CALL ZVEZDA, THE CREW COMPARTMENT THAT'S THE SIZE OF A PASSENGER BUS HERE ON EARTH.

HAM RADIO IS GROWING RAPIDLY IN SPACE, ALONG WITH THE INTERNATIONAL STATION ON WHICH IT'S INSTALLED.

FOR THE AMATEUR RADIO NEWSLINE, ROY NEAL, K6DUE

--

The Expedition 4 crew will remain on board the ISS until May. And according to Frank Bauer, KA3HDO, another important task is to bring the automatic packet system back on line. He says that ground technicians are working with the astronauts and cosmonaut on that project and that task will continue as crew time permits. (ARNewsline from information provided by ARISS, NASA.)

**

HAM RADIO RECORDS: 24 GHZ DOWN-UNDER

A new distance record is set on a band where even commercial interests are only now starting to tread. And its a group of Australian hams who have set it. Q-News Graham Kemp, VK4BB, has the details:

--

A new Queensland distance record on 24.048.1 GHz USB was established morning of Tuesday 08 January over a 72.8 Km path. Location 1 was at Wellington Point, with VK3ZQB and VK4ZHL portable. Location 2 was at Caloundra, with VK3XPD and VK5DK portable operating.

Signals strengths up to 5x5 after initial optimization with typical daytime QSB. The visiting team are continuing with local propagation experiments. The challenges of building and operating microwave amateur radio equipment are wonderfully rewarding in many ways!

From Q-News Australia, I’m Graham Kemp, VK4BB, for the Amateur Radio Newsline.

--

Further experimentation is expected to bring even more record setting contacts in this very microwave ham radio band. (Q-News)

**

RESTRUCTURING: BIG LICENSING SUCCESS IN THE UK

A new slow-code license recently introduced in the United Kingdom is also setting records. This in the area of people flocking to get it. Jeramy Boot, G4NJH, days that the new British Foundation License is on its way to becoming a major success:

--

The Radio Licensing Center reports that, as of the 7th of January, exactly 600 of the new M3 Foundation Licenses had been issued.

In the 'QSO Party' for Foundation Licensees that took place on the 1st of January it is estimated that about 100 M3 stations were active. Many joined the one-minute-past-midnight 80-meter net and many more were heard working DX during the subsequent days.

One person active on the 1st of January was Mike Marsden, M3BQH, who also holds the callsign G8BQH. Mike reports that he worked Alex, UR5EDU, in the Ukraine at

two seconds past midnight, using 10 watts on 40 meters. The report was 59+10dB. After a few hours' sleep M3BQH worked 66 stations on the first day, with only two short CQ calls.

"The pile-up queue was never ending, I even managed to work seven other M3s", Mike said.

Jeramy Boot, G4NJH

--

To put this in perspective. The UK has 57,814 hams so 600 is about 1%. Here in the United States we have close to 625,000 licensees. That’s the equivalent of getting 6250 hams signing up for a new license class here in the USA in only a few short days. (GB2RS)

RADIO REGULATIONS: FCC'S APPROVES DRAFT WRC PROPOSALS

The FCC’s Advisory Committee for the year 2003 World Radiocommunications Conference has approved its preliminary draft proposals. The document has been assigned as D-A-02-101 and deals mainly with satellite and terrestrial allocations in the UHF and microwave bands. Amateur Radio is only briefly mentioned in the area of 890 to 1350 MHz allocations.

The Advisory Committee itself was formed in January of 2001 to assist in the development of United States proposals for WRC 2003. DA-02-101 is based primarily on the committee report. Comments on it are due on it no later than January 28th.

The complete of 55 page text of DA-02-101 is on the FCC website at http://hraunfoss.fcc.gov/edocs_public/attachmatch/DA-02-101A1.txt (FCC)

**

ENFORCEMENT: CLEAN UP THE INTERFERENCE - PLEASE

The FCC has written to an A-M radio station and an electric power provider to help resolve an unusual and long-standing interference situation. One affecting local amateurs in the Cincinnati and Mason Ohio areas. Amateur Radio Newsline’s Don Wilbanks, KC5MFA, brings us up to date:

--

The letter suggests that multiple sources may be involved in this interference case. Also that two that are possibilities are Cinergy Corporation and radio station WLW. Cinergy is the electric company to the affected area and WLW is a Clear Channel Communications owned power-house AM station serving the greater Cincinnati area from a transmitter in Mason.

WLW operates on 700 kHz with 50,000 Watts into a single element diamond shaped half-wave vertical tower. This is only one of two such towers left in the United States, the other belonging to WSM AM in Nashville Tennessee. Both were constructed in the early 1930's by the now defunct Blaw Knox Construction Corporation.

One of the amateurs affected is Bob Reiff, WA8ULW, of Mason. Reiff told the ARRL Letter that while the noise is most noticeable on 160 meters, it's showing up elsewhere. He says that some local hams suspect it is even causing problems even on a two meter repeater.

In its letters, the Commission says that it recognizes this to be an unusual case. It says that the source of the interference could turn out to be something else unexpected. But the Commission adds that it is turning to the radio station and electric utility company and asking for their help in finding the source of the noise plaguing the Mason ham community. It's also asking that both cooperate with the technical experts from the American Radio Relay League in solving the problem.

For the Amateur Radio Newsline, I'm Don Wilbanks, KC5MFA.

--

By the way, More information on this very interesting Blaw Knox diamond tower design and the ones installed at both WLW and WSM is available on-line. Simply take your browser to http://www.wsmonline.com/w_homepage/tower/index.html. Its very interesting reading. (FCC, ARRL, Amateur News Weekly)

**

ENFORCEMENT: UNLICENSED OPERATOR TOLD TO EXPLAIN

A former ham that the FCC says may have been on the air without a license has been asked by the agency to provide an explanation. The person posing the questions is FCC chief ham radio rules enforcer Riley Hollingsworth, K4ZDH. And in a recent Rain Enforcement log, Hollingsworth outlined the situation:

--
Hollingsworth: "We requested clarifying information from Brian Bailey, ex-KD5PXQ. His license was set aside by the Wireless Bureau on October 19th. We want to know his exact whereabouts on two specific days in September. Bailey has been in touch with us and is deciding weather to provide the information."
--

According to Hollingsworth, the information that the FCC wants from Bailey relates to allegations of unlicensed operations and malicious interference. (FCC, RAIN)

HELPING HAMS: HAMDIHAMS NEW E-MAIL ADDRESS

This note: The Courage HandiHam System has a new electronic mail address. You can now reach the group at handiham@courage.org. You may also contact its Director Pat Tice directly at wa0tda@arrl.net. (HandiHams)

**

CONVENTIONS: HAMVENTION SAYS BRING YOUR BUS AND LAVE THE PARKING SPOT TO US

Free parking at the HARA Arena for Hamvention? Well, kind of. Its free if you leave your car at home and charter a bus to bring in a pretty large group of people to the event. Amateur News Weekly's Phil Thomas, W8RMJ has the not so complex details:

--

For Amateurs who charter a bust to make the annual journey to Hamvention, the Dayton Hamvention Committee will reserve a parking place for your chartered bus for the entire three days of Hamvention. The reserved parking will be close to the HARA Arena Complex, allowing not only a place to secure your valued purchases, but also a place to rest those weary feet after walking many, many miles of Hamvention. Space is limited for the new charter bus parking area. Pre registration is required. Availability is on a first come, first served basis.

--

For more information on the new on-site charter bus parking offer or to reserve a space, please contact the Dayton Hamvention office. It's open normal business hours Eastern Standard Time at are code (937) 276-6930. You can also fax your request toll free at
1-800-491-4267. (Amateur News Weekly)

**

CONFERENCES: SE VHF SOCIETY IN APRIL

Greg Robinson KB4NVD says over the VHF Reflector that the Sixth Annual Southeastern VHF Society Conference will take place April 26th through the 27 Th. in Oak Ridge, Tennessee. The conference, hosted by the Southeastern VHF Society, promises to be an interesting and exciting event with presentations from accomplished VHF and up amateur radio enthusiasts from several parts of the country. Registration, program details, hotel and travel information can be found in cyberspace at www.svhfs.org. (SE VHF Society)

**

HAM RADIO EVENTS: KIDS DAY A BIG MID-WEST SUCCESS

The first Kids Day operating event for 2002 was a rousing success in many venues. But in one Mid-West city a bit of coverage on a local T-V station helped to make it even better. Again to Amateur News Weekly and reporter Jack Parker, W8ISH:

--

Kids Day at the Indianapolis Chapter of the American Red Cross got a boost when event coordinator Stece Wendt, KB9RDS, made an appearance on a local TV news program. During the two minute segment. Wendt told viewers that all kids and their parents were welcome to share in the Amateur Radio experience, including an introduction to Morse Code, VHF repeaters and HF:

--
Wendt: “And then we turn around tand take them over to the big radios -- the big base station radios where they can talk -- literally -- around the world.”
--

This is the second year the local Red Cross chapter has shown young people how to tune in the world.

Reporting from Indianapolis Indians for Amateur News Weekly, This is Jack Parker, W8ISH.

--

This is just one of many Kids Day success stories. We will have more in future Amateur Radio Newsline reports. (Amateur News Weekly)

ARNEWSLINE(tm) FINANCIAL UPDATE WITH N6TCQ

It’s time for a report on the financial situation here at Amateur Radio Newsline. With it is our Support Fund Administrator and Corporate Treasurer, Andy Jarema, N6TCQ:

--

It is January of 2002. A brand new year for ham radio. And the beginning of another year for us here at the Amateur Radio Newsline. And as we start off the new year, here are the current finances.

Looking in the new corporate checkbook, the balance shows us at about $700 give or take a few bucks. Not very much when you consider that it takes over a thousand dollars a month to produce these weekly 20 minute Q-S-T’s.

Obviously, Amateur Radio Newsline is going to need your help -- and -- need it quickly to keep it from going away and to keep the news of ham radio coming your way.

We have done all that is possible from our side to keep costs under control. But, some fixed expenses like the telephone and long distance calling are a must have. So are electronic mail and world wide web access. There is the cost of the routine maintenance on the tape machines and editing gear. And in a few months the Newsline sponsored Young Ham of the Year Award will be rolling our way. All of this adds up and some costs just keep going up. When you add it all up and average it out, it comes to that $1000 a month figure I just mentioned.

So now is the time when Amateur Radio Newsline has to ask to ask that you help to keep its newscasts coming your way. Your tax deductible contributions can be sent to the Newsline Support Fund, Post Office Box 660937, Arcadia California. The Zipcode is 91066.

Ill be back within the next few weeks with an update on how things are going. For now from the Amateur Radio Newsline support center, I'm Andy Jarema, N6-Tiny-California-Quake.

--

Don't worry if you missed the address. It will be repeated in a few minutes at the end of this weeks newscast. (ARNewsline(tm) Support Fund)

**

ARNEWSLINE(tm): WE ARE GOING MP3

One other piece of news concerning Amateur Radio Newsline. As of March 1st, we will be dropping Real Audio and going exclusively MP3. Why the change? Well ever since we began posting a downloadable MP3 file at our own FTP site along side the Real Audio file, 9 out of 10 people have chosen the MP3. And with good reason. MP3 simply sounds a lot better than Real Audio to most of you. And by dropping the Real Audio, we can make the MP3 sound even better by encoding at a higher bit rate.

Right now, you can still compare the two formats if you like. Until February 22nd we will continue to post both Real Audio and MP3. Take the time to download both. And don't worry. Most modern media players including Real Audio, Microsoft Media and Winamp play MP3 so the chances are that you are already equipped to cover of the digital format change. (ARNewsline(tm))

**

SCIENCE AND TECHNOLOGY: THE NOISE OF EARTH

According to Space Daily, researchers have known for three decades that the Earth is a potent radio transmitter, but they were never able to pinpoint where the noise was coming from. Recently, by using data from the four spacecraft of the European Space Agency's Cluster mission, NASA-funded scientists have precisely located the source of the radio noise along the magnetic field lines. The noise originates several thousand miles above bright regions in the Earth's
northern lights. (AMSAT, Space Daily)

**

INTERNATIONAL-CANADA: ARE AGREEMENT IN B.C.

Turning to international news, Radio Amateurs of Canada which sponsors that nation’s Amateur Radio Emergency Service has signed a Letter Of Understanding and the British Columbia Provincial Emergency Radio Communication Service. The letter represents the collaboration between Radio Amateurs of Canada’s British Columbia Section Manager Fred Orsetti VE7IO and Supervisor of Information and Communications Technology for the Provincial Emergency Program Andrew Bryan VE7KSN, to provide a cooperative plan to carry out emergency communication. The letter also further enhances the work of the Canadian ARES program and compliments the Memorandum of Understanding signed May of 1994 between Radio Amateurs of Canada and Red Cross. (RAC)

**

INTERNATIONAL - CANADA: VE1AWA RESIGNS AS MARITIME PROVENCES SM

Due to personal reason Roy MacIntosh, VE1AWA has stepped down from the position of Section Manager for the Maritimes. Tom Caithness, VE1GTC has been appointed acting Section Manager pending outcome of the upcoming election call. (RAC)

**

INTERNATIONAL - UK: AMSAT-UK COLLOQUIUM

The 17th AMSAT-UK Colloquium will be held at Surrey University in Guildford from the 26th to 28th of July this year. AMSAT-UK is now inviting speakers to submit papers about amateur radio space and associated activities for this event and for the Proceedings document. Offers of papers should be submitted as soon as possible and should be sent only to Richard Limebear, G3RWL. His e-mail goes to g3rwl@amsat.org. (AMSAT-UK)

**

HAM RADIO IN SPACE: WEBSITE UPDATE

AMSAT reports that IK8XLD has updated his website with information about satellite operations, EME, the ham radio operation on the International Space Station, ATV and homebrew equipment. You can visit Rocco’s website at www.qsl.net/ik8xld. (ANS)

**

DX

In DX, DJ4KW and DK9GG are active from Belize as V31YN and V31GW respectively until about the 2nd of February. Activity is on CW, RTTY and PSK 31. (GB2RS)

And KE1F will be active on 10 to 160 meters CW, SSB and perhaps RTTY as ZF2LM from Grand Cayman Island from the 14th to 30th of January. (GB2RS)

Also R1ANF began operations as CE9 slash R1ANF on the 29th of December from a Chilean base in the South Shetland Islands. He is active on 10 to 28 MHz with 100 watts to an R6000 vertical. For all three, QSL as directed on the air. (OPDX)

Last but by no means least, word that JX7DFA, is on a job assignment to Jan Mayen. He is operating as LA7DFA. QSL via his home call. He will reply when he returns home in the Spring. (Modern DX)

**

THAT FINAL ITEM: A CALL FOR ARDF HUNTERS FOR THE WORLD GAMES

And finally this week, 2002 may be the biggest year yet for fans of hidden transmitter hunts, especially the ones that are all on foot. Amateur Radio Newsline’s Joe Moell K0OV helps coordinate happenings like these and has news of two major events.
--

Every two years, hams from around the world gather to see who is best at on-foot hidden transmitter hunting, also called foxtailing, radio-orienteering and ARDF. There are separate events on eighty meters and two meters, each with five transmitters scattered in a forest that can encompass 1000 acres or more.

Competitors are divided into five categories for males and four categories for females. Each country may have up to three persons per category on its team.

Back in Y2K, the championships were in China, with a dozen stateside hams among the competitors from 26 countries. This year, the excitement moves to Slovakia and takes place from September 2 through 7. Once again, ARDF Team USA will be there.

Would you like to be on that team? If so, contact me right away, because USA must submit its Letter of Intent to the Slovakian hosts by the end of January.

Of course you'll need lots of practice beforehand, and you can get plenty by attending USA's own national ARDF championships, which will be April 19-21 in Pine Mountain, Georgia, near Atlanta.

Find out about both championships -- Slovakia and Pine Mountain -- by visiting my Web site: www.homingin.com. Homingin is one word. Then apply for the Team USA roster at my e-mail address on that site, or by postal mail to my callbook address.

Maybe you'll bring home a medal this year. From southern California, where this year's local radio-orienteering training sessions will begin soon, this is Joe Moell K-zero-Oscar-Victor for Amateur Radio Newsline.

--

In case you missed it, Joe’s website is www.homingin.com. “homeingin” is one word. (K0OV, ARNewsline(tm))

**

NEWSCAST CLOSE

With thanks to Alan Labs, Amateur News Weekly, AMSAT, the ARRL, the CGC Communicator, CQ Magazine, the FCC, the Ohio Penn DX Bulletin, Radio Netherlands, Rain, the RSGB and Australia's Q-News, that's all from the Amateur Radio Newsline(tm). Our e-mail address is newsline @arnewsline.org. More

information is available at Amateur Radio Newsline's(tm) only official website located at www.arnewsline.org. You can also write to us or support us at Amateur Radio Newsline(tm), P.O. Box 660937, Arcadia, California 91066.

A reminder that the nominating season for the Dayton Hamvention Radio Amateur of the Year, Technical Achievement and Special Achievement Awards closes January 31st. Nominations should be sent to Post Office Box 964 Dayton Ohio 45401. They can also be filed using the e-form at the Hamvention website. Its at www.hamvention.org.

For now, with Bill Pasternak, WA6ITF, at the editors desk, I'm _____ saying welcome to the year 2002, 73, and we thank you for listening." Amateur Radio Newsline(tm) is Copyright 2002. All rights reserved.

>Clear as a bell...
>
>...That's what I'M talkin' 'bout!
>
>We're readin' the mail ;-)

I could never understand what the hook for skip was. I had a radio that talked all over the world and I had MUCH more fun aggrevating everyone in my home town. Nothing really serious, just a little harmless ball busting was all I ever did. Dropping carriers, harassing the local cb riff raff. Stuff like that. I haven't had a radio set up in a few years, but reading some of these messages makes me wanna set back up and commence to some harassment. If I lived near YOU, that's what I'd do EVERY time I heard you trying to shoot skip. Heheheh! What fun.....

Regards,
Jeff

Um, we are talking CB here. Flip the switch and turn the clarifier.
Big whoop, it ain't difficult.

>SSB signals DO fade. Anyone who's tried to copy a rare DX station and
>have the band die just as the pileup is thinning out can attest to
>that.

Again, we're talking CB. I don't know who you talk to, but when I'm
yakking to someone 60 miles away the SSB signal doesn't fade.

>The audio quality may be a matter of personal opinion, but monitoring
>both SSB and AM audio, I'd have to say that on a radio capable of
>producing both types of signals, typically the audio on the AM signal
>will wound richer, fuller, and warmer. It's just a matter of having
>more than twice the bandwidth in which to transmit the signal.

Then I guess that's a matter of personal opinion. Personally, it's my
opinion that SSB has audio that's cleaner and more easily understood.

>The main advantages of SSB are greater range, and less bandwidth
>requirements (meaning more intelligible signals can be carried within
>a given frequency range, or band). SSB signals are favored among
>amateur operators for voice transmissions because of these reasons.

The SB220 is another amp like that.

Although it uses a WAY more rugged tube than the 3CX800s. Couple mistunes
with them and you can strip the grid away. Operated correctly, and they
have
near infinite life! (in amateur / cb use)

As most of you know, I post mainly from this account but from time to time I do post from my tra1n@aol account also.
This will cease as of 3/1/02 as AOL has increased their BYOA (bring your own access) tariff 50% in one shot and I see no need to continue to their service. I've been on a cable modem from the day it was available in my neighborhood and this is the service I will continue. AOL, by going from $9.95 per month to $14.95 per month is telling BYOA CUSTOMERS that they are no longer wanted on their SERVICE and I for one will would be more than happy to never send them one more cent!

You had it going on!! Julies is very good, which is why they are still there. Frenchys is real good, too. That is some seriously expensive real estate these days. My grandad almost bought a little motel (15 units) right around the corner from the Holiday Inn on Coronado back in the 70's for around 65 grand. He was into other things back then and passed on it in the end. Today, an area that covers a few parking spots would probably run close to 65 grand over there.

By the way, they dredged the pass and put in a new bridge to Sand Key (awesome fishing) and the voters approved a new one from downtown Clearwater to the beach going across the causeway to replace the drawbridge.
You probably know about the scientologists buying all of downtown Clearwater. Everyone freaked when they started buying all the prime real estate there but they actually made downtown come alive again with little shops and boutiques.

I know the whacko's (scientologists) owned the Fort Harrison retreat thing on ....Ft Harrison but I didn't know the extent of them buying up the downtown area. I still go to the Sheraton Sand Key Suites but the Bridge was out the last time I was there a few years ago with my wife. We had to go through Indian Rocks Beach and all that to get back into town at the time. I think I told the story of getting Domino's to deliver us pizza's in the parking lot at the beach.....It was good times to be sure!

> What fun.....
>
> Regards,
> Jeff

go ahead....i agree.....in the day, it was always a local
thing......as soon as skip rolled in, everyone got off the
radio.....nobody i knew liked skip and nobody cared about it...there
was always radio wars going on, but of a local nature, and everyone
had their own home channel and if you were not on your channel , you
were asked why you aren't by the indigineous inhabitants of the
particular channel you were attempting to talk on.....my thing was to
go from channel to channel and do war, and i was very good at it...my
implements of war, were black cats, and palomars and varmints. i used
a as400 starduster 100 feet off the ground and buddy i got out. and i
would not quit until i ran everyone off of that channel , at least for
the evening..needless to say some people liked it and thought it was
funny and some didn't....so i batted about .500. but this went on at
least two , maybe three times a week for years......and then one day
it stopped....and that was it.....it was like a period of maybe one
year, the cb channels went quiet...and for the most part, they are to
this day......except channel 6, or 11 or 26 and the skip talking...but
about 1995, the bottom fell out......people started doing other
things, and some people started dying........oh well.....your post
reminded me of the old days......mr jones is back quiet....

2447. Ham Radio University 2002 for Long Island

Newsgroup: rec.radio.cb
Date: 2002-01-19 01:55:13 UTC

Cross-posted to: rec.radio.cb,rec.radio.scanner,rec.radio.shortwave

Ham Radio University 2002/ARRL New York City-Long Island Section Convention

North Babylon, New York - On Sunday, January 20, 2002 at 8AM, the doors of the Babylon Town Hall Annex on Phelps Lane will open for the third annual Ham Radio University. Ham Radio University 2002 is a day of education about Amateur Radio.

This year the forums have been expanded and new forums have been added. There will be twenty, one-hour presentations with special forums geared to the non-ham as well as the experienced ham radio operator. The focus will be "hands on" with many demonstrations.

Come join us at the Babylon Town Hall Annex, Phelps Lane, North Babylon, Long Island, and learn about everything from satellite communications, low power operating using radios as small as a tuna tin, how to put up an emergency antenna, the latest information on advanced digital communications, finding and fixing radio frequency interference problems to purchasing your first station equipment or handi-talkie and a special "Ask the Experts" forum. There will also be a Special Event Station W2V set up and operational on HF. There will live SSTV pictures uploaded to the NLI WWW during the event.

TALK-IN W2GSB/r 146.685 -600 110.9 PL

HRU 2002 is sponsored by the Great South Bay ARC and is a cooperative effort between over twenty clubs and organizations in the New York City- Long Island area. It is also the American Radio Relay League, New York City-Long Island Section Convention. Besides the forums, there will be tables set up with information about the different groups, ham radio classes, exam session schedules, public service and other activities.

Join us for a day of fun and education for the whole family!
Admission is open to all - donation is $2 per person.
(complimentary refreshments available)

For more information contact:
Phil Lewis N2MUN, Chairman, n2mun@arrl.net or call 631-226-0698
George Tranos N2GA, ARRL NLI Section Manager, n2ga@arrl.org or call 631-286-7562

Why? The Bird meters are more precise (repeatable) than Dosey meters.
They are also probably more accurate (closer to being right).

It IS possible to design a diode detector meter so that it reads the
correct power, even with complex waveforms. But the diode has to be
operated around the zero intercept point - the so-called "square law
region" of the diode characteristic curve.

Neither the Bird 47 or the Dosey meters operate at that part of the
curve.

Reread what I wrote.

> A choke isn't varied from design standpoint by the turns to diameter ratio?

Certainly. But you don't need a fixed diameter, or a fixed number of turns.

This is a bit confusing and incomplete. A single sideband signal has
the carrier plus one sideband suppressed.

> and reduces the amount of interference to stations on adjacent
> frequencies. Sideband signals are, however more difficult to tune in
> because of the reduced bandwidth and the absence of a carrier.

It cuts the bandwidth usage in half. But that does not mean that you
can stuff twice as many signals into the same amount of bandwidth.

> SSB signals DO fade. Anyone who's tried to copy a rare DX station and

Yep. If the pileup is dying out, then you can bet that the CX is fading
as well.

But you don't have twice the bandwidth. The sidebands are mirror
images of each other. You have no more fidelity with a full AM
signal than you would have with a Am signal with a suppressed sideband.

> increase the number of channels.

Yes and no.

Let's say you have a town with all stations operating SSB with legal power levels. If the stations randomly use upper and lower sidebands, you will only have an average of 20 channels available at any time. For example the station on 2 upper would interfere with 2 lower and 3 lower. So the next station might be on 4 lower, which would interfere with 3 upper and 4 upper etc.

Now, assume that all stations in this town used lsb, and that they only interfered as above. So 2 lower would interfere with 2 upper, 3 lower would interfere with 2 upper (which no one is using because of the interference from 2 lower) and 3 upper. In this case, there are 40 channels available.

Further assume that there is a town some distance away where there would be interference if operating on the same sideband, but not if on different sidebands. If the people in this town all operate on usb, then they also have 40 channels available.

The end result is - for a single local area, there are only a maximum of 40 channels useable at one time. But for an extended area, there are 80 channels - even though there wouldn't be if both towns all operated on the same sideband - or worse, randomly chose the sideband that they used.

I, for one, cannot understand how AOL can charge so much for a dial-up service. I've been sitting on the fence for a while as I am paying $14.95 a month to AT&T plus another $9.00 or so to Frontier for internet caller id, internet call waiting, and call-forwarding (you have to get the call forwarding). That brings it to twenty four bucks. Road Runner is available, but to get it for $40.00 a month you have to be a customer - I subscribe to Direct Tv. A while back, DSL became available through the local telephone company. That is also $40.00 a month - and is considerably faster than Road Runner. Well, they introduced a slow-speed DSL. Only 256 Kb per second (as opposed to 3 Mb for their high speed home service), but for only $26.95 per month. I checked and can get it and suspect that it will be up and running shortly (hey, it's almost an even trade in money, and I can use the telephone simultaneously whilst I surf). A lot of companies are raising their dial-up rates; meanwhile, back at the ranch, the DSL is getting cheaper.

I had a DSL line in here until cable was available. I was paying 49 a month for that and at the time it was a rather slow 200k or so. I now pay #(for cable and have cable in the house anyway so I now have a 70 a month cable bill. As DSL lines have become faster I might consider it when my cable contract expires at the end of this year. As it stands ring now, in my area cable is still the king for speed and uptime. DSL went out on me twice in the 3 months that i had it..... Once for 2 week and again a week later for 3 weeks.

A properly tuned SSB type accepted transmitter has its audio cut to
about 3Khz of bw.

So technically, Sparky is correct.

In common use, though, it is a completely different story.

The SSB signal will seemingly travel farther, as the inherent background
static
is lower with SSB reception, the sensitivity is higher, etc.

However, in <<actual>> use, with typical CB type radios, it is another
story.

From a mobile with a 5 or 6 element flatside, trailered behind a van with a 25 thousand watt amplifier, your gonna need one HELL of an antenna to get him.

You can talk antennas all you want, but when it comes to the big guns of 27.025, you need a lot of power INTO that antenna as well.

DB gain isn't the only thing those boys play with.

Hello Train: Yeah AOL is nothing but pure high grade BS!

At one time they charged me almost 4 dollars a hour, for a 1.2K modem speed, and it was long distance.

But the icing on the cake was, in their bulletin boards, I believe it was for scanners, I mentioned that ISP servers were charging only $19.95 a month, and it was bargain as compared to AOL's prices.

Well AOL took my posting off, and would not allow anyone to talk bad about AOL. I think thats why there was so much How Raw on the net as to no censorship, on other web sites and such.

I called the boys and girls at AOL and offer my consulting services, to improve their system. I told them I am terrible expensive, but worth it!

They declined. And so is their business now. I told em, but Ted wouldn't listen, it figures.

Jay in the Great Mojave Desert, ... just down the road ah ways from the fillin station.

You are suggesting PIN diodes to a person that, until until about a
month ago, thought ground-bias Class C push-pull was a great idea for
a linear amp for AM because it used fewer components and was therefore
more reliable.

Steve, I'm not trying to be rude here, but this is a subject that has
been going on for years in this newsgroup. Like I said, it might be a
good idea to get a little background on these Skywave amps. Go to
groups.google.com and search for posts on Griffey's Skywave amps
(easier in advanced search), grab a brew, kick back and enjoy.

Just another comment on the 'peak and tune'. A nice fellow recently obtained a Connex. He was (note the use of the past tense - pay attention) very happy with it. His post of 1/7/02 states he had just obtained it and 'it swings a lot'. On 1/17/02 he was letting everyone on the board know how well it worked. A new post on 1/18 states that the finals died. SWR was 1.1 to 1. I wouldn't let anyone make any mods to a radio. Who knows what the finals were subjected to? I wouldn't expect a new radio to die in a week and a half and I suspect that 'peak and tune' had more than a little in frying the finals.

> I just gave another option, thats all.

You certainly can. The difference is that the coax coil and the ferrite beads (if enough beads are used) will do a good efficient job. Steel wool will not.

>> > A choke isn't varied from design standpoint by the turns to diameter

I didn't say that. The number of turns will depend on the diameter of the coil - as well as the frequency on which you are operating. Extra turns will not hurt anything - except for the slightly greater normal coax attenuation losses you will get.

True. But that does not have anything to do with what I wrote.

For that matter, there are a heck of a lot more AM stations than there
are SSB. In most areas of the country, I suspect that 1 or 2 SSB channels
would be a more justified allocation - based on number of users.

No I meant 80, four times the dipole because the folded dipole is a dipole doing impedence transformation. Inside a room with things to couple to a regular dipole will have an input impedence nearer 20 ohms than 73.3. Folding it simply makes a bad situation better.

OK, I think the full term is electrostatic field and each of us has chosen
to use half of it, kind of like engines where a 'four stroke cycle'
becomes 4-cycle and a '2 stroke cycle' becomes a 2-stroker.

It means you have a decent antenna and a filthy amp.

Every amp produces harmonics, multiples of 27 MHz. In a lot of cases
these are intentional so that they show up on a meter and cause your head
to go up and down and reach for the wallet.
Your antenna is merely returning the trash and garbage back to the amp.

The length of the coax when things are clean and decently matched is
irrelevant BTW.

Source record: 112831

Hi all...

I recently bougth a Handlheld Garmin Etrex GPS. Details at :
http://www.garmin.com/products/etrex/

Studing the manual, i discovered that i could receive my global
position trough a serial port of my garmin. And so, as a computer
scientist, i though in transmit this information to my web server so i
could do whatever i want. But at this point, appears the question...
How its the best way to transmit this information?
Supose i would take it in my car, and i will use a radio, what are the
maximum range that i could get?
In case of stoping the car by a remote command, could this (in car
radio) receive information too?
The relief of my city is not plan. That are some places that Etrex be
"out of service". I have to amplify its signal too.
Considering that i didn't have any infomation about radios, i started
to think in my Nokia 6120i celular phone. It has an internal fax/modem
and comunicates with the computer trough a serial port.I though it
would be easy to use serial comunication bettween the system and the
phone but i discovered that Nokia do not publish articles about the
protocols. The solution to transmit information could be design a way
to make the system "press the buttons" and send messages as emails.
But, how could i stop the car? You can say:
call the phone and the system will detect a phone ring and will stop
the car.
Not secure...
Phone ring only four times...
Not secure too...
A good way would be send a cryptographed message to the phone, read it
and stop or not the car. But how?
Another way i though, was call the phone, and using it as a modem,
send a cryptographed message to the system. Perhaps, this second way
would compel the system to have and control a modem what i don't have
experience direct with hardware.

And so, the project is based on the steps below...

1 . Choose the best way to transmit the global position or implement
one.
2 . Project the main board (I think this step could be done with a
litle modification at the minimum 8051 schematics).
3. Write the assembly software.
4 . Amplify GPS antenna.
5 . Project the power suply for all the system.

If you feel yourself able to the job, please mail me at
mreletricus@yahoo.com with your plans and your price.
If you consider this project so easy that you could make it in a few
hours just for fun, send me the project or post it here, you know.
If you have any contributions, please, post it.

Thanks.

Gently and with patience. Prodding them with your cane just makes them back into a corner and bare their teeth. They'll eventually get it, Aaron. Just be patient. Take care and 73.

You might as well just hook a 50 ohm resistor to the back
of your radio. It would work just as well. Go get a small
magnet mount if you don't want an efficient antenna.

A glass mount has no ground to work against and the radiating
element is much too small.

My news server didn't work Thursday, so I jumped over
to my spare server. News is again working in the Bmore
area. That's good because I don't have to pay for BW
to use the comcast one.

I just went by comcast's bmore location Friday. They bought
the building across the street from their old one. Now they
have two buildings...

Sorry but I am afraid you will not get too much usefull information. Like Scott said, glass mount antennas just do not perform well enough to make then worthwhile, you might as well chuck the radio and use a cell phone or one of those frs radios.

Hello Dick: Here a thought!

Look at a sine wave, and then draw in the second harmonic. It evenly
adds and subtracts from the fundamental sine wave. Its possible that
even harmonics will not effect a SWR or watt meter measurement.

Jay in the Mojave

Top Ten He said/She said

#10 He said..."I don't know why you wear a bra; you've got nothing to put in it."

She said..."You wear briefs, don't you?"

#9

She said..."What do you mean by coming home half drunk?"

He said..."It's not my fault ... I ran out of money"

#8

He said..."Since the first time I laid eyes on you, I've wanted to make love to you in the worst way."

She said ..."Well, you succeeded."

#7

He said... "Two inches more, and I would be king."

She said..."Two inches less, and you'd be queen."

#6

On wall in ladies room: "My husband follows me everywhere."

Written just below it: "I do not."

#5

He said..."Shall we try a different position tonight?"

She said ..."That's a good idea...you stand by the ironing board while I sit on the sofa and
fart. "

#4

Priest... 'I don't think you will ever find another man like your late husband.'

She said...'Who's gonna look?'

#3

He said..." What have you been doing with all the grocery money I gave you?"

She said..."Turn sideways and look in the mirror."

#2

He said..."Let's go out and have some fun tonight."

She said..."Okay, but if you get home before I do, leave the hallway light on."

And the number 1 He said / She said...

He said..."Why don't you tell me when you have an orgasm?"

She said..."I would, but you're never there."

Aaron, I have often stated that if some of the guys just leave things alone, any problems will eventually take care of themselves. Please read and reconsider the necessity of flaming:

==>FCC AFFIRMS $10,000 FINE IN AMATEUR PIRATE CASE

The FCC has fined a Texas man $10,000 for transmitting without a license on an Amateur Radio band. Following a Notice of Apparent Liability issued in September, the FCC affirmed the $10,000 fine in a December 26 Forfeiture Order to David Edwin Merrell of Wichita Falls. The FCC said Merrell did not respond to the NAL.

In its earlier NAL, the FCC said it was acting on "numerous complaints" from the amateur community that an unidentified station operating on 7235 and 7238 kHz in the 40-meter band was causing "intentional interference to authorized communications." The FCC's High Frequency Direction Finding network determined that the signal was located in the Wichita Falls area. Last June, agents in the FCC's Dallas office monitored an unidentified station on 7220 kHz and determined that the transmission was coming from Merrell's residence. "The station did not identify and transmitted only one-way broadcasts," the FCC said.

During as station inspection, Merrell "admitted to the transmissions and stated that he did not have a station operator license," the FCC said. Unconfirmed reports to the FCC indicate that Merrell may have continued to occasionally transmit on 40 meters following the FCC visit.

"Considering the entire record and applying the statutory factors listed above, this case warrants a $10,000 forfeiture," the FCC concluded. Merrell has 30 days from the date of the Order's release to pay the fine. If not paid, the matter could be referred to the Department of Justice for collection.

No, I don't. I have seen some real good advice from Scott (unit 69) - at least I think it was Scott. His advice was to enjoy but try not an intentionally start a jam-fest on the air. The FCC has bigger fish to fry.

73 from Rochester, NY

But a sine wave is equally above and below zero in any case. But a tuned
antenna including a 102" whip will be a crummy load to the second (the

third is radiated) harmonics. The reflection of even harmonics for sure and odd ones if the antenna is not naturally tuned there (i.e. a loaded vertical) is why the SWR goes up with the amp. A good LPF would cure the SWR and lower the meter reading at the same time.

On 27.555 MHz USB / 2055 UTC , there was this guy who has been counting for the last 30 minutes.

Here is how he is counting:
1....2....3....4....5...Radio-check....6....7....8...9..Radio Check.

Another operator was cussing this guy's ass out.

He evidently gave up (WUSS) and left the channel.

"The counting fool" was still counting.

Agreed. Although 20 ohms is not a real problem - it produces under a
3:1 VSWR, which is what I consider to be my limit for directly connecting
to the transmitter.

The folded indoor dipole at 80 ohms would be great for matching.

Personal preference I guess, I would much rather look up at a load than
down on it and would prefer a slightly inductive load to a capacitive one
if I can't tune the finals. Just old habits.

2524. Frontec 7000 foreign CB Radio

Does anyone know where I can get a schematic for a "Frontec 7000" cb base station. I got it off of eBay last year and cannot find any information on it. They said it was a foreign cb radio (aren't all cb radios "foreign"?) and that info was likely not to be had!

Thanks for any info!

> And a lot less TVI!
>
>
> Toll_Free
===

Hi Toll.

That depends upon many other factors.
When CB was first legal here, we were given just 4 Watts FM, and only allowed antennas upto 5 feet in length. If the antenna was over 21 feet off the ground, you could only use 0.4 Watts.

The amount of TVI back then would probably surprise you, but people were encouraged to use poor antennas close to the ground. The main difference was that FM TVI was constant while keyed up (patterning or buzzing), AM TVI caused patterns that varied with the modulation (or audio breakthrough), and SSB obviously caused pattening with the audio (or distorted audio breakthrough).

One thing with AM, is that the extra power with modulation could just be enough to cause inteference when a 4 Watt carrier didn't. But with FM, your voice couldn't be heard, so the sufferer would blame the one with the biggest antenna or the neighbour that they didn't like anyway.

===
> "steve" <stevejfranklin@attbi.com> wrote in message
> news:3C41CFC4.C7DFA29D@attbi.com...
> > Much rather have FM mode radios , sounds better, goes further.
===

FM certainly does *not* go further than AM, and the receiver noise wipes out the audio on weak signals... even on a very quiet channel.

One way in which the FM receiver does beat AM is with noise immunity. You do not need a noise blanker with an FM CB, most impulse noises do not get through the receiver.
The "capture effect" of FM can also be useful at times.

Personally, my ideal CB system would be FM for local with SSB for distance and bandwidth.

Brainbuster.

Weird, on my radio I can hear a station on 27.440 USB and if I hit LSB
I can hear a different radio LSB/USB on the same 27.440

I USE SSB and I rarely have to use RIT(Clarifier) I set my frequency
step to 5kc jumps and I change around the frequencies without having
to use any RIT.they pretty much come out solid without that nasty
donald duck effect.

Im using a Icom IC-78, maybe they have narrower filters and more
stable VFO oscillators but SSB mobile is not a complicated affair on
my side. just tune and hit transmit (or press FC and go t channel mode
and use the regular 40 cb channels)

Thats junk

the IC-78 Commercial radio is solid and will basically last a
lifetime. Infact those radios are popular with the Rebels in Colombia
they survive the humid enviroment and rough conditions.

I posted a review on deja, search for it and you will find it on the
newsgroup

I feel for you. I think I know who you bought that from and they have sold a lot of crap through Ebay. I wish Ebay paid as much attention to that shit as they do amps and exports.

Yeah sure. Like export radios. They were left alone by hams. After
all, who cares about what goes on outside the ham bands? Then CBers
started showing up on 10 meters. Same advice: "just leave them
alone". Care to take three guesses on who are the ones giving the
advice, Jim?

2546. Re: Best Performing Glass Mount CB Antenna

Newsgroup: rec.radio.cb
Date: 2002-01-20 00:42:36 UTC
From: Dave or Debby <truth@planetc.com>
Message-ID: <3c4a1554@news.planetc.com>
Source record: 112782

Chuck the CB ? Are you NUTZ? I have sold "Glass Mount" CB antennas for years, from the 1st Avanti AV-200 that was about 15" that looked good on small sports cars, to a cell phone antenna. The BEST one for CB was 3" long and Avanti or AS made them. I don't think I can get them anymore but I could try. I usually steer people away from getting one, because I usually have something better for less that will work better. E mail me direct @ truth@planetc.com and let me know what vehicle you have and I may have something that will work better, or I can find out next week if the 3' one still is available.
Dave!

I think if you did not want old Voobner to post you would refrain from starting threads with my name in them. Face it, you guys are bipolar. On the one hand, I make you crazy, on the other hand, you love me.

As far as Landshark goes, he is the OT (Original Troll) in rec.radio.cb. Do a search and see if you can't find Sharkie flaming and trolling like an insane person.

OK, well you started this thread so we might as well use it. What does "888 in the WaterGate" mean? Is that a keyclown term that means that you have Washington DC comms jammed?

-Aaron-

2548. I hooked up a NOS AM/FM/CB/PB 8 Track today...

Newsgroup: rec.radio.cb

Yep, brand new in the box 24 years old. I have a few left, probably should put 1 on e bay to see how high it will go. Anyway, I KNOW Jay will love this report. It was kept in a cool but not cold basement for most of those years, in it's box, in cardboard. I hooked up this N8 approved unit and tuned it up, and looked @ the 8 track belt, and it was STILL GOOD ! Later I played an 8 track tape on it & it worked MINT! HEY does anyone have an 8 track to CD adaptor out there? Did I give you TECHnology shock? Sorry about that! Anyway, the ONLY thing on it that don't work is the pushbuttons for the stations (Analog Dial). It seems to want to move but don't; manual tunes OK. Motorola 950 CX model # I think. I sold a few of the Cass. versions in the early 80's. I felt like I was 20 years younger--I haven't messed with any of these units for A WHILE ! Made me think of THE GOOD OLD Days !

> feel better about myself.
===

It may help to remember that many of those who "whine and argue" on
here are NOT CBers. Some say they are radio amateurs, and others say they
are neither CBers or Hams.
Maybe the problem with this newsgroup is that too many Hams use it as an
"alt.flame" group, knowing that they can go back to their Ham groups when
they have done whining about CBers.

Nobody is forced to use this ng. If anyone on here has a dislike for CB,
CBers in general, or this group, then they know where the door is.
Those that dislike the posts from certain people can block those
messages (usually).

So, are you a CBer, a troll, or just another Ham coming on here to bitch
and whine about CBers in general in an effort to stroke your own ego?

I find some of the technical "heated discussions" quite interesting, and it
must make many on the group "hit the books" to check their own view is
correct, see who has it right, or find references. All that learning can't
be a bad thing.

This is NOT intended as a dig at the resident "Hams" and "Techs" who give
a good input on this newsgroup (including history lessons from those who
knew Noah)... just at the few noisy grumpy trolls who are only here to
cause anger.

Brainbuster.

SSB is all but dead in San Diego.

1 channel in Houston was active.

I would agree with Bill on this one. Yes, their are users during skip, but
for the most part, most areas use a channel or maybe two for ssb use.

My response was more to Sparky, than you, Bill.

Poster asks:
>For TVI prevention, should I coil the coax 6-8 around the base of the mast?

Sparky replied:
If you run it inside the mast, you don't have to worry much. You can
coil it around the mast, but do it at the base of the antenna, not the
base of the mast

The I replied to Sparky
>Coiling your coax is a much better option, though. Ease of construction.

And Sparky replied
Wrapping RG-8 around a 1-2" pipe isn't always easy.

Therefore, he was telling the person 6 to 8 turns around a 2" diameter form (the mast)

That's all I was trying to say, not that you where necessarily wrong, but that the number of turns
needed to be changed, since the diameter had as well.

==

Would you like a reference?
Radio Handbook 23rd edition (William I Orr, W6SAI) page 5-3...

<quote>
SSB power rating:
The ssb transmitter is usually rated at peak envelope input
or output power. Peak envelope power (PEP) is the
root-mean-square (rms) power generated at the peak of
the modulation envelope.
</quote>

===
> PEP ="The average power supplied to the antenna transmission line
> by a transmitter during one radio-frequency cycle at the highest crest
> of the modulation envelope , taken under conditions of normal
> operation."
===

I have one rather like that...

<quote>
Interpretation
Peak Envelope Power (pep): The average power supplied
to the antenna by a transmitter during one radio frequency
cycle at the crest of the modulation envelope taken under
normal operating conditions.
</quote>

-- Radiocommunications Agency document RA190
(April 1992) Page 59.

===
> Example:
>
> A 4 watt carrier at 50 ohms = 14.14 volts RMS
> A 4 watt carrier at 50 ohms = .2828 amps RMS
>
> 14.14 volts RMS = 40 vp-p
> .2828 amps RMS = .8 amps Ip-p
>
> So let's use your incorrect formula now (PEP = Vp-p * Ip-p)
>
> 40 * .8 = 32 watts PEP?
> All this from a 4 watt carrier? Give me a break.
===

Also consider standard CB power meters...
If the allowed SSB power (12 Watts) is obtained by multiplying peak-peak
V and I, but the AM power (4 Watts dead key) is using rms readings, then
a power meter that reads AM power correctly would show 12 Watts pep
of SSB as just 1.5 Watts.

12 Watts = 24.5 volts at 0.49 amp (50 Ohms)

If that was peak-peak, then converting to rms...
8.66 v * 0.173 amps = 1.5 Watts measured on an rms reading meter.

If the meter measured SSB correctly, then 4 Watts AM would read
as 32 Watts on the meter.

AVERAGE POWER...

I just found a reference for average power...
Electrical and Electronic Principles 2 Checkbook
J. O. Bird and A. J. C. May
Highbury Colledge of Technology, Portsmouth.

Page 103...
<quote>
the average power dissipated, P, is given by:

P = VI = I² R = V² / R Watts (V and I being rms values)

</quote>

There is a diagram showing how the power only goes above the zero line (once
for each half of the wave). At any one moment, the voltage is either +ve
or -ve... not both at the same time. So at any time, the power is due to
either the positive or negative *half* of the cycle... not both.
So, you cannot calculate power from a peak-peak reading... that would assume
that the current is going both ways at the same time, when it isn't.

Regards,

Brainbuster.

Took a good nap before what you were driving at seeped thru the old brain. Ain't quite at the level of second-pass coffee grounds but getting there.

If you had a DC to light scope, you might in fact see something like that if you could feed them separately but what you would also see that you would get some vector addition. Take the case of a second harmonic down 10db: halfway up the fundamental, pi/4 if you like, you would have .707 (square root of two/2) or the sine from the fundamental plus .1 from the harmonic or .807. You would begin to 'square up' the waveform.

While sitting in math class contemplating the pert ass of a coed and considering the odds of a horizontal tango you will be presented with the Law of Fourier: any waveform no matter how gnarly can be described by some sine curve and a mixture of its harmonics. If distant memory serves if you could build an amp that generated all harmonics equally the output would be a square wave. I know, French mathematicians get off on this sort of thing; wait til you hear about Poisson.

And, of course, it works the other way: screw up a waveform and you get harmonics. You have just hit on why bands in the early days were on multiples: Marine bands started at 2,4,6,8 etc and hambands on 1.75,3.5,7,14 etc. Blessed hard to keep a spark or tube cw for that matter from spitting on multiples. While it is almost never done these days outside of FM transmitters it was pretty common in days of old to set up say an oscillator on 7 MHz, a final rich in harmonic output, and tune the baby to 21 MHz; Push-pull finals made admirable triplers and I once owned a transmitter that had the finals in push-push and had to double in the finals -- was a Meck, one of the companies that built Maggotbox in the bankruptcy sale along with several others including the Incomparable Capehart and Fabulous Farnsworth.

Yes indeed, you can draw the harmonic within the fundamental but they do add. This is an issue BTW in the long and agonizing argument over wattmeters. If you calculate back from peak values, a second harmonic reduces the reading while a third increases it. My feeling? If it don't

heat water, it ain't a watt.

No one mentioned Twisty except you, Tim. Are you Twisty's manager now?
And no one has to beg for Twisty's attention. He inserts himself into
a thread as he pleases, unless whatever is in the thread makes him too
freaked out.

Au contraire, Ozark. Fantasies of becoming a federal agent in order to wreak havoc on the public are pretty much confined to comic-book villains, deeply troubled adolescents, and the criminally insane....

Source record: 112932

Didn't relize they were so big!!

I asked this news group for info on a Cobra29 LTD Classic radio awhile back. I
can't find the post or replys now, but I took someones advice and visited Peg Legs site. I also emailed him on 1-14 and have yet to get a response. His site lists VR4 as the AMC and metions adjusting it in many mods. I am having ppl tell me my radio is loud all the time so I thought I would back off on this VR4 a little, but was told it wasn't making any differance. After taking a closer look only one side of it is soldered to the board with the other side just sticking through to the back of the board. As you can see from the pics there is also nothing to solder it to on the front or back of the
board. VR5 is the same and a couple more. This is telling me they aren't doing anything, but it doesn't make sense that they would put them in there for looks. Can someone explain?

You only need two of the three legs for the VR to do anything... You need the center pin (the one attached to the variable control) and either one or both of the side pins; it just depends on what it's function is. VR4 is indeed the AMC control... If it's not working, perhaps someone has bypassed the control, or removed the mod-limiter, essentially making the VR useless...

Power House

Im sure it will be gone..
It is not doing well now..
Ham radio I feel is not doing all that well either.
Once the current generation is gone I think the numbers are going to start tumbling.
The internet killed the radio.
I will still keep my equipment though.. :)

The Jackson is a good choice as previously stated, however I have to
say forget about the 2510's..
I am not saying the 2510's are a bad radio, but the finals are a a
pain in the ass when they blow. Quite expensive. I had 2 2510's and
one 2600.. The 2600 was better but needed the chipswitch..
2950's on the other hand may not be the best quality around but they
are the most bang for the buck. Finals are cheap, and they are simple
to modify.

OY YOU - GIVE US A JOB!!
---
submitted by Sarah Gooding

THESE ARE TAKEN FROM REAL CVs AND COVERING LETTERS

1. I have lurnt Word Perfect 6.0 computor and spreasheet progroms.
2. Am a perfectionist and rarely if if ever forget details.
3. Received a plague for Salesperson of the Year.
4. Wholly responsible for two (2) failed financial institutions.
5. Reason for leaving last job: maturity leave.
6. Failed bar exam with relatively high grades.
7. It's best for employers that I not work with people.
8. Let's meet, so you can 'ooh' and 'aah' over my experience.
9. I was working for my mom until she decided to move.
10. Marital status: single. Unmarried.Unengaged. Uninvolved. No commitments.
11. I have an excellent track record, although I am not a horse.
12. I am loyal to my employer at all costs. Please feel free to respond to my resume on my office voice mail.
13. My goal is to be a meteorologist. But since I possess no training in meteorology, I suppose I should try stock brokerage.
14. I procrastinate, especially when the task is unpleasant.
15. Personal interests: donating blood. Fourteen gallons so far.
16. Instrumental in ruining entire operation for a Midwest chain store.
17. Note: Please don't misconstrue my 14 jobs as 'job-hopping'. I have never quit a job.
18. Marital status: often. Children: various.
19. The company made me a scapegoat, just like my three previous employers.
20. Finished eighth in my class of ten.
21. References: none. I've left a path of destruction behind me.

** COUNCIL COMPLAINTS
---
also submitted by Sarah Gooding

These are extracts from actual letters sent to various councils and housing associations throughout the Southeast of England.
---

* I want some repairs done to my cooker as it has backfired and burnt my knob off.

* I want to complain about the farmer across the road; every morning at 6am his cock wakes me up
and its now getting too much for me.

* The man next door has a large erection in the back garden, which is unsightly and dangerous.

* Our kitchen floor is damp. We have two children and would like a third so please send someone
round to do something about it.

* I am a single woman living in a downstairs flat and would you please do something about the
noise made by the man I have on top of me every night.

* Please send a man with the right tool to finish the job and satisfy my wife.

* I have had the clerk of the works down on the floor six times but I still have no satisfaction.

* My bush is really overgrown round the front and my back passage has fungus growing in it.

* I wish to complain that my father hurt his ankle very badly when he put his foot in the hole
in his back passage.

* .. and their 18 year old son is continually banging his balls against my fence.

* I wish to report that tiles are missing from the outside toilet roof. I think it was bad wind
the other night that blew them off.

* My lavatory seat is cracked, where do I stand.

* I am writing on behalf of my sink, which is coming away from the wall.

* Will you please send someone to mend the garden path. My wife tripped and fell on it yesterday
and now she is pregnant. We are getting married in September and we would like it in the garden
before we move into the house.

* I request permission to remove my drawers in the kitchen.

* ..50% of the walls are damp, 50% have crumbling plaster and the rest are plain filthy.

* I am still having problems with smoke in my new drawers.

* The toilet is blocked and we cannot bath the children until it is cleared.

* Will you please send a man to look at my water, it is a funny colour and not fit to drink.

* Our lavatory seat is broken in half and is now in three pieces.

* Would you please send a man to repair my spout. I am an old age pensioner and need it badly.

* This is to let you know that our lavatory seat is broken and we can't get BBC2.

* .. and he's got this huge tool that vibrates the whole house and I just cant take it anymore.

* .. that is his excuse for dogs mess that I find hard to swallow.

2608. Re: I hooked up a NOS AM/FM/CB/PB 8 Track today...

Hello Dave: Its always important to listen to Rock n Roll, regardless of the using media, or place, time, or anything else.

Case in point:
While flying back east a short time ago, they over booked the folks in Coach, and put me in Business Class. Great, free Booze!

The gentleman setting next to me was a young man with a very expensive Sony personal CD player. He said "Its makes ya want to do tunes all day long"

"Yes" I replied. Kind of like saying Rock on Dude!

He let me listen to it. It sounded like a full blown outside audio threater. "Bitchen" I said.

The gentleman went on to tell me about his music career, in Hip Hop, and that he is building a Chevy Suburban for CB Competition, and needed some high quality and high fidelity outside speakers. I told him that Electro Voice use to make them, and that I was sure they are still being made by someone out there. Just hit the net and ye shall find em!

He wants ta get down while droppin the Maul! Good show!

Hello Scott: Goodstuff!

Had a guy that all he did was to recite rules and want a Union. He's now outside looking in. The old Man fired him for the common good of all.

Come to find out he's being sought after by another State for fraud, something about Union funds missing. He he he. I would have loved to see that guys resume.

Rock On!

Heah its my ol bubby "complain and whine" JR Troll-O-Matic.

We hear all the old fart hams on the FRS, on our scanners, they use their modified 440 Ham UHF radios, amplifiers, and antennas.

They slip up a lot and use their Ham call signs, a laugh a minute.

We play the conversations back for them at coffee when they get on their I am legal, and hate you CB'ers high horse. Man do they slip down in the seat.

Then Dave (one of the older Hams, he loves to stir the pot) will tell them that in 2003 the morse code test requirement will be dropped, and all the CW frequencies will be dropped for phone operations. Man is that funny you can see the Mushroom Cloud going off, big time. This is better than live TV in the 50's and 60's. As the cackling gets loud, and the finger pointing starts, its hard not to laugh.

A good time is had by all, Miss Dinah will tell us to quiet down or hit the road. We even have the Ham guys calling each other "Pigeon". CB Slang term meaning gullible, ect.

Jay in the Great Mojave Desert, ... just down the road ah ways from the fillin station.

FRS shares some of the business band. The band is virtually the same frequency as 440 MHz amateur band. No, there are no 'linears' for FRS. There are amps, but they are class C - FM requires no linearity. They are also not for use with FRS. I can assure you that if FRS shows up with amps there WILL be a problem - big problem - with commercial users. Since commercial users pay for the use of this (try using a commercial repeater - I worked in one shop - they DO monitor the usage of their repeaters) you will be facing a far more formidable foe than trying to move up into 10 meters. Lotsa luck. Most likely someone was trying to sell you modified 440 gear for use on FRS (why couldn't he unload it as 440 gear? Makes one curious as to how well, or badly, it worked).

I, for one, do not enjoy seeing a website state there are 40 channels and
also state that CB starts at 25.1 MHz. For the record, the legal 40 would
not pose a problem with SWR - the range of frequencies is not that great.
It is only when you get into freebanding that SWR can become a problem
requiring an antenna tuner.

Aaron, you'd best point out the requirements of being an FCC engineer. One had best have an engineering degree plus, likely, have at least passed the bar exam and be able to practice law. Getting fired from your job plus a NAL would be the least of your worries. Just wait until you get disbarred.

sparky
> open though).

Thats funny you mention Sparky I have never comversed with him, but of
course you guys would know better. I am still using @home Moped, but I see
you still use newsreader and hotmail and x archive all your posts what
gives?

Can't find my manual, can someone tell me the procedure to disable the button beeps on this radio.

Thanks.

You DON'T KNOW who you are talking to, nor are you thinking! I have sold these and the cassette units years ago; put stereos in for over 22 years & my own since '73 or so, and you say that I may of forgot to set the pushbuttons?! You described right how it is done--pull out, push in to set and move the dial to the station before. You change the AM/FM with the end pushbuttons--that works, but the pushbuttons moving the dial pointer/actually changing the station--THAT IS the problem. I may rip it open again next week wit da oil or see what I should do. I ain't dat old yit to furgit how dem pushbuttons set! I AM da Analog man!
Dave!!!!!!!!!!!!!!!!!!!!!!!!!!

Steve,
no insult meant, but how the hell
did you blow a finial on a 2510?
I've had 3 2510's one since 1984
and have never blown a final. For that
fact, I have never blown a final in
any radio, a few boxes, but never
a radio.

Also I have notice C73 is missing and D11 is cut. So I am guessing my radio sounds like poo on the other end. I am going to reconnect D11, but I will have to get a cap. Then VR4 should work correctly. Right?

Antenna Jay in da Moehabee:
You are wrong! It is ALWAYS important to AVOID Interracial Babylonian cornfusion noise because of what it does to yo brain! WHY do you bring this up? He who gets drunk is NOT WISE, the Bible teaches. I had enough of that in da past, and if I would of only done 1/10th of it or less, I would be a lot richer today, probably selling N8 ALL his illegal pictured radios! But I was young & foolish until Jesus Saved me from these sins, and now I can devote more $$$$$ to my CB business!!!!!!! Besides, People out there are GOING TO hate me for saying it, but if you research the roots of Rock, you will find out that IT IS the "music" of Communism!!!!!!!!!!
Dave!!

2646. Re: Simple explaination of the antenna

Newsgroup: rec.radio.cb
Date: 2002-01-20 18:47:36 UTC
From: lkilgore@xmission.com
Message-ID: <3c4e1062.143573740@news.xmission.com>
Source record: 112884

In the explanation, it stated that CB starts at 25.01, when it
actually starts at 26.965. It also said that a quarter wave-length
antenna is just under 10 feet, while it is actually about 8.5 feet.
It needs some corrections, in my opinion.

This is done daily by hams all across the USA, you are able to track them where ever they are from a web page.

Get you ham license then get on uhf/vhf and set up your own station with gps, computer tnc etc... .. All legal too.

Selling crappy products? That's being dishonest, Dave. You are
definitely going to hell. If you don't believe me, check with your
pastor, preacher, bishop, or whoever is the head of your, um, sect.

Hello Dick: I don't know what the FM Dev is, or what its supposed to be?

It just all comes thru the scanner real good.

The boys are now taking the little antennas off the radios, and plugging their base station antennas in for longer distances, makes it easier to hear them all.

Jay in the Mojave

2662. WTT: Digital Camera for CB

Newsgroup: rec.radio.cb
Date: 2002-01-20 20:59:12 UTC
From: karting2002@aol.com
Message-ID: <20020120155912.20358.00001667@mb-mb.aol.com>
Source record: 112950

I have an Epson Digital Camera PhotoPC500 that is 3 years old but has very little use.It has a viewscreen and video out jack and cable. It uses compact flash cards and has 4mb of built in memory. I will include 1 64mb card that will hold 100's of standard resolution photos. The compact card memory is then removed and placed in a Lexar jumpshot usb reader (included with drivers). The pictures are recongized as standard JPEG files readable by any graphic software even Internet Explorer. Its not as small or high resolution as some of the new Cameras out today. But it takes a great picture. I still have the original manual but a nice bag, but no box.
I would like to trade it for a new or like new CB of equal value for a trip I have coming up this week. Please email if interested. Located in Lewisville, Tx. North of Dallas.

Robert

Yep, I heard from a ham the other day that because THINGS in general are
degenerating (because of the communist takeover of this country), and that
IF the Hams don't get NEW BLOOD (get it--Blood!) into their bands, den da
Candy Man CAN take dem bands away from dem Long Hair Hippie Freqs. and da
short haired Hams and dey will have no more place to go, but to DA FREEBAND
! Being as lazy and cheap as most hams are, they just come here to MY CB
NewsGroup and start with their "hate" campaign against CB, in whatever form
of CB there is, to VOOB them out of here to 2 meter CB and other Ham bands.
NOW WE KNOW what is the FEAR that drives N8, VoobNerd, and the other digital
pencilnecks that keep on bashing our FAVORITE BAND, the People's Band, yes
it IS the Citizens Band!!!!!!!!!!!!!!!!
(any good Hams dare to comment?) !
Dave!!!

I am looking For Schematic or Manual for a - 70 CM PD-ATV-50 PAULDON
or, and old broshures.
and any info about the bricks, Amps -M67728 or M67705M
Where can they be purcased how much they cost.. I have digital
pic if you need more info

Thank you

Tom KF6RTY email- mrthoms7@pacbell.net

heheh no, actually (this will really bug Dave) Metallica has taken the bible to write several of their songs. For example the song "Creeping Death" was taken from the bibles account of the 10th plague on egypt that god used to set the nation of israel free from bondage.

Many other bands as well have used the bible for inspiration, and ave says rock is bad.

Another quote for dave, Matt 7:1 "Stop judging that YOU may not be judged;7:2 for with what judgment YOU are judging, YOU will be judged; and with the measure that YOU are measuring out, they will measure out to YOU. 7:3 Why, then, do you look at the straw in your brother's eye, but do not consider the rafter in your own eye? 7:4 Or how can you say to your brother, 'Allow me to extract the straw from your eye'; when, look! a rafter is in your own eye?
7:5 Hypocrite! First extract the rafter from your own eye, and then you will see clearly how to extract the straw from your brother's eye.

Keith

For example, the Grateful Dead have a song about Sodom and Gomorra and
another about Esau, Issac's brother.

Any recommendations? Also where's a good palce to get?

Any recommendations on an inexpensive SWR/Power Meter?

Thanks,
Jason

or a guy has one for sale on qth.com also.....personally if i were
you, i would go for the one on ebay....nice chassis, henry
built.....just needs a little tweekin for what you have in mind, i am
sure...such as silver plating some components, ...vacuum caps etc,
etc.......good luck...if i had the extra change i would go for
it...but not right now.....i have seen rigs like that before on ebay.
i think they use them for medical reasons or whatever......

2706. Installation Of Radio Transmitting Equipment

Newsgroup: rec.radio.cb
Date: 2002-01-20 23:58:02 UTC
From: "Scott (Unit-69)" <upplus@hotSPAMmail.com>
Message-ID: <3C4B5978.B73F7C7A@hotSPAMmail.com>
Source record: 112993

This is from the manual of my new Jeep
(My comments in parentheses):

Special design considerations are incorporated into this vehicle's electronic system to provide immunity to radio frequency signals. Mobile two-way radio and telephone equipment must be properly installed by trained personnel. The following must be observed during installation.

Power connections should be made directly to the battery and fused as close to the battery as possible.

(We are all in agreement here.)

Antennas for two-way radios should be mounted on the roof or the rear area of the vehicle. Care should be used in mounting antennas with magnet bases. Magnets may affect the accuracy or operation of the compass on vehicles so equipped.

(We are all in agreement here.)

The antenna cable should be as short as practical and routed away from the vehicle wiring when possible. Use only fully shielded coaxial cable.

(That sure blows holes in the coax length bullshit.)

Carefully match the antenna and cable to the radio to ensure a low Standing Wave Ratio (SWR).

(We are all in agreement here.)

Mobile radio equipment with output power greater than normal may require special precautions.

(This means HEAVY cable for your DC requirements!)

All installations should be checked for possible interference between the communications equipment and the vehicle's electronic systems.

(Is that fuel pump noise I hear?)

The Factory in Solon, Ohio, near where I am from, calibrates them there.
They use an antenna instead of a DUMMY Load, and I guess the real perverts
"convert" them to peak meters, suposedly, to deceive others into believing
dat dey is doing mo watts, when it is just a peak reading! Dey can't
calibrate a Bird, but dey can adjust da PDC, I think!

Tim, it stated 40 channels. That, to me, implies normal, legal CB. The problem I have is the implication was that CB 40 channels runs from 25.1 to whatever. That is erroneous. I generally don't care too much as long as the unlicensed stations stay out of amateur bands, police bands, business bands, marine bands, and broadcast bands. But please give newcomers a chance. Let them know where the standard 40 channels are. If they choose something else, so be it; but don't lie to them.

"What has THE WICKED to do with my statutes, says The Lord?"
We ALL make "judgments" every day. It is my hope that you will all repent
of Sin pursuant to 2 Chron. 7:14 before it's too late! Do a study on the
job of the Holy Spirit (to convict of Sin, of Rightousness, of Judgment.).
Also read the last few Psalms too. Then you will understand what the true
Church is suppose to be doing!!!!

He is likely just trying to make a sale. A friend of mine bought a new CB which 'swings like crazy'. He was so happy when he got it that he posted about it on January 7, 2002. A post from him two days ago indicated the finals were fried. It's going to cost him $100.00 to get it fixed - and put in condition so it won't fry again. Nothing like making a sale.

Jay, I sincerly doubt what you say. Why would a ham want to use FRS? My 440 HT with six double a alkalines has worked Australia through a 10 meter port. I enjoy a good 50 + mile range from any repeater I can hit (and I can hit 'em 40 miles away - what is 50 plus 40?). Of course, there is the autopatch - which came in useful last night when the wife wouldn't get off the phone. Just picked up the HT and made my call. None of this is possible on FRS frequencies. Of course, considering how bone-dumb stupid simple the exams are, I could stretch my imagination and consider it was a newly minted codeless tech; even then, they would have to be totally lacking in knowlege about 440 operation to want to use it on FRS. More likely would be 'borrowed' callsigns for their wives to keep in touch through the repeaters. Why would a ham want to cob up his gear and possibly render it less effective where it was intended to be used? BTW, the use of CB slang has increased a bit. Most likely a result of more CBers getting their ham ticket. As stated, the exams are very simple. Way too simple (no, I am not talking about Morse here).

What Dave H. said is basically true. Units that COULD BE converted were sent back to the factory ONLY, where they were put in an assembly line with 3 shifts working in the summer of '77 when I was in a tech room that "fixed" them when they dropped out of being able to convert in the line, because of problems in the radio that failed the test in the line. I remembered a "cool" super tech one night THROWING a CB against the wall when he couldn't fix it! We really did NOT know much of what what we were doing then! It was wild! The line was probably 50' or more long!

NO, you didn't buy a FORD so you will have NO fuel pump noise problem! Also IF you just run a regular 2 - 4 amp CB fused CB, you CAN go to the fuse box OR the Cig. plug outlets. Yep, it blows away the Druggies on 18' coax too! 95% or more shielded is the only thing that matters! Run RG-58 ! You DON'T NEED 8x ! You ain't runnin' over 50' ! (But can you tell these Parroting druggies anything?!)
Dave!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

Frank,
You have to admit that for a non-technical, 'pocket'
explanation of CB radio it really isn't that bad. It
gives a clear idea without getting too far in to the
technical stuff, which most people coulden't care less
about anyway. It certainly isn't ~THE~ definative article
about CB radio, but it's certainly one of the 'better' ones
that I've seen.
'Doc

Up to how many wattage CB can be hooked up via the Cigarette lighter? Also what about a small low wattage Amp? 100-300watts lets say?

Any overall wiring advice?

Thank,
Jason

You can pull a RELIABLE 3 to 5 amps.

Usually a cig lighter is wired up through the factory harness, and most vehicles use light (sub 12 gauge) wire to wire up the lighter.

Citizens' Band (CB) Radio

The use of illegal CB equipment is an oft-cited cause of interference
and can affect television and radio reception, hospital radio-paging
systems, police, fire brigades and ambulance services and aircraft
landing systems. Operators of approved CB sets sometimes use
transmitter powers or aerials greater than those provided for under
the licence conditions. Such use amounts to unlicensed use and
prosecutions may be brought. In-band abuse such as the use of obscene
language and playing music can also be a major problem. Where possible
the Agency takes action against people who use CB radio either with no
licence or outside licence conditions. For details on what can be done
about CB abuse see RA 344 Abuse of Citizens' Band Radio. Latest
prosecution figures can be viewed here.

> above 40? Things that make a side-bander go hmmmm..

The answer lies I think in a bit of history. CB is a generally mobile medium and SSB is essentially a base activity; it is just a bit tough to tune with the average SSB mobile for a rookie.

On the ham bands, mobile communication where the object is more local is done on VHF/UHF FM so 10 and 12 tend to be fixed stations and it is the mobiles conforming not the sidebanders.

If your point is that AM is dead, dead, dead among anyone doing communication for real, I can but agree; the AM/SSB wars were fought early in my amateur career give or take the 60s and it is apparent who won and why.

It seems that CB is two groups (three if you count truckers trying to get away from both) and is pretty well destined to remain so. On a personal level, I have found SSB types to be sane and gung-ho AMers by and large to be scum. You have probably also noted that you meet a different sort of derelict on 12 meters than you do on 10.

Depends a bit on what you drive. My screaming Mopar has the lighter on a 15 amp fuse shared with the horn wired with a good grade of #16 or 18 so the IR drop would not be nice. On some of the Ford cutaways I drive the lighter draws 25 and the circuit would probably power an arc welder.

If you have to draw 160 watts to radiate 4 I might suggest an investment in a new radio.

Thanks a lot for the advice!

If i were to use an amp rated at 10 Watt RMS input Max would that be
acceptable for a 4watt radio with 12watt SSB?

Thanks,
Jason

Jason,
Check the fuse in the cig.lighter circuit. That's the
~most~ you can draw through the lighter circuit, and it's
smart to draw much less than the maximum amount.

Sorry to sound like such an ass at your first asking but there has been a pissing contest about RMS and PEAK watts going on for over a week. Something small and inexpensive would be along the line of a Palomar 225. While like many of the smaller amps, these do hold up well for some time. When it finally does die.....Toss it out and by that time you'll either be happy with the service you got from it or ready to move on to bigger.

Thats a hundred watts peak input amplifier, give or take

You should see somewhere in the neighborhood of 50 to 70 percent efficiency out of it, equating to 50 to 70 watts PEP output.

Its running about right. Id give about 25 to 30 dollars for it used, good condition.

Yes... Your out put would be down about 50 percent, but if its a class AB amp, it will be very clean..

Class C, it might sound very distorted, both AM and ssb, since not being driven to the point of self bias by the amount of overdrive.

Not sure of the buy price as I purchased it used and it's currently on
eBay at around $200.

Insured shipping to the US by air will be approximately $30-40.

Whatever they are, it appears that the decline was just temporary. This
cycle is having a second major peak - just like the last cycle. It may
be another couple of years before the bottom drops out of propogation.

It depends on what you consider "low". To me, anything under
about 2:1 to 3:1 (depending on the rig) is "low".

> Mobile radio equipment with output power greater than
> normal may require special precautions.

> (This means HEAVY cable for your DC requirements!)

It may also mean extra efforts to ensure that there are no currents
on the outside of the coax. You may need to add various interference
suppression devices on some items in the rig.

> All installations should be checked for possible interfer-
> ence between the communications equipment and the
> vehicle's electronic systems.

> (Is that fuel pump noise I hear?)

More importantly, that the rig does not interfere with such things as
the engine computer or the anti-lock braking sensors etc.

CB radios do not draw 8-12 amps, only 1-2 amps - even on transmit.
If I recall correctly, the cigarette lighter is fused at 10 amps in
most vehicles.

No, all a decent beam accomplishes is taking power you are spraying in all directions and pointing it in one, power does not appear by magic. It helps the receive in that direction as well and does both without messing up your signal. Hells bells, it generally even sends some amp trash back for processing.

So in the grand scheme, you are more likely to make a contact with a beam with less disturbance to your neighbors and perhaps ultimately to realize that the amp under the desk is gathering dust.

There is nothing wrong with relays! They are used in many modern devices and have certain advantages over other methods. The relay I'm using is a sealed Aromat.

My bias is accomplished with a 1Amp capable regulated source. While temperature compensation is nice, I've found that at the bias level that I wish to operate, the bias "drift" over temperature is not significant.

nah, we all just nod, laugh politely and move on, kinda like when I used to run a group home for people with psych problems, one of the clients living there used to come up with some really wild and funny ideas on his perspective of life.

Keith

Metallica has taken the bible to write several of their songs. For
example the song "Creeping Death" was taken from the bibles account of
the 10th plague on egypt that god used to set the nation of israel free
from bondage.
-
Many other bands as well have used the bible for inspiration, and "Dave"
says rock is bad.
For example, the Grateful Dead have a song about Sodom and Gomorra and
another about Esau, Issac's brother.
-
And several concerning God and the devil and the triumph of good over
evil.
And Samson said, "Delila, cut off my hair."

<20020119085333.21442.00000348@mb-fk.aol.com>... Face it, there are
people that just want to buy a radio and gab on it. They don't care
about rare DX. They don't care how a Chebyshev filter works. They don't
want to experiment with antennas. They just want to BS a bit on the CB.
They want a plug and play solution. They have heard "extra channels" and
"power" makes for a better CB. How do you reach these people and
motivate them to stay within the law without pushing them towards ham
radio?
-
Gently and with patience. Prodding them with your cane just makes them
back into a corner and bare their teeth. They'll eventually get it,
Aaron. Just be patient. Take care and 73.
Mark

You're absolutely right, if any recruitment is to be done, it should be freebanders going up and recruiting the hams.

The problem with that is that the hams aren't good prospects. We need people who have a legitimate interest in radio and aren't afraid of a little qrm. We need people who can take a tough band to operate and make it work.

The average no-coder sits at home with his pecker in one hand and the mic of his two meter radio in the other, and kerchunks the repeater all day.

The average cellular phone user is more technically inclined than these no-coders.

In preperation for Black History month (Feb.), one of my black HEROINES is Julia Brown. For 2- .34 stamps I can send you a printed copy of this old pamphlet photocopied; and re-typed here true & correct. Here is the unedited and un-commented upon (by me) copy that I am typing directly from:

Mrs. Julia Brown spent more than 9 years as a member of the Communist Party in Cleveland, Ohio, serving as an undercover operative for the FBI. She "surfaced" in 1962, to testify in Washington about her experiences and to describe how the Communists plan to use Negroes as "cannon fodder" in their program of racial agitation. Today, se continues to risk her life on coast-to-coast speaking tours, expoxing the Communist-led revolutionaries who pose "a clear and present danger" to Americans of every race.
Mr. J. Edgar Hoover, the director of the FBI, once called Martin Luther King (MLK) "the most notorious liar in the country." I agree with him. But I also believe that MLK was one of the worst enemies my people ever had.
I know that it is considered poor taste to speak ill of the dead. But when someone served the enemies of this country while alive, and his name is still used by his comrades to promote anti-American activities, shouldn't people that know the truth speak out?
I learned many surprising things while I served in the Communist party for the FBI. Communist leaders told us about the demonstrations that would be started, the protest marches, the demands that would be made for massive federal intervention. Every Communist was ordered to help convince American Negroes that we are no better off than slaves. Wherever we went and whatever we did, we were to promote race consciousness and resentment, because the Communists know that the technique of divide & conquer really works.
We were also told to promote MLK, to unite Negroes and whites behind him, and to turn him into some sort of national hero. We were to look to King as the leader in this struggle, the Communists said, because he was on our side!

(Picture of a check) This check, from an official Communist front and signed by 2 identified communists, is just 1 of many payments to MLK from the sworn enemies of our country.

(Photograph) This photo was taken at a Communist training school in Tennessee. It shows (1)MLK, (2) Abner Berry of the Central Committee of the Communist party, and (3)Communist Aubrey Williams of the Southern Conference Educational Fund, and (4) school director Myles Horton.
I knew they were right, because while I was in the Communist Party I learned that MLK attended a Communist training school. I learned that several of his aides ans assistants were communists, that he received funds from Communists, and that he was taking directions from Communists.

Most Americans never look at the communist press in this country.
If they did, they would learn that communists loved MLK. He was one of their biggest heros. And I know for a fact that communists would have never promote him, financed him, and supported him if they couldn't trust him. He carried out their orders just as slavishly as Party members in Cleveland, Ohio.
MLK may never have carried a Communist Party membership card. That's not important. Most of the people the Communists counted on to furthur their work were not official members of the communist party. But I am certain as I can be that he knew what he was doing! And I am just as certain that the drive to glorify him now is just as much a Communist project. Through it, the Communists expect to raise millions of dollars to help further their programs, to gain even wider acceptance for their campaign of civil turmoil, and to further divide the American public.
But none of this has to happen. Although many Americans are still deceived about MLK, more and more are learning the truth. I want to assure every reader that what I've said is the truth. I urge everyone to investigate this crucial issue further. Please, make sure of the truth. For it is only through honest information and sincere efforts that the problems of this country can be solved.

(on the back---not her words it says):
We hope that the information in this brochure will cause more Americans to reflect on the real nature and subversive intent of the campaign to confer "sainthood" on a man who collaborated closely with Communists, who accepted directions and funds from Communists, and who furthered Communist purposes all his adult life.
Copies can be obtained from truth@planetc.com . E mail me direct.

What does this have to do with CB's? With more communism, we have less of everything, including CB's!
Dave !

They will sooner or later pull the plug on the 11m band.

> Ham radio I feel is not doing all that well either.
> Once the current generation is gone I think the numbers are going to start
tumbling.
> The internet killed the radio.
> I will still keep my equipment though.. :)

You should if you're a Ham. The congress is looking for a way to maintain communications during times of national need, such as 9/11. In addition they also want a way to maintain Internet connectivity too. The ARRL has explained to those naive congress persons that is what Ham Radio can do, and has done so many times in the past as well. The chances that Ham Radio will simply disappear is just not going to happen, in fact it will get even more support, for the emergency communications Hams provide, from congress.

Yes Professor, relays do a great job for switching RF, and they or proven and reliable. Just kidding about being out of date. When I first built an amp, my choice was also relays, this was in the early 70s. Later I had to find a better way, because at 500 MHz and higher I needed a low loss, low inductive switch for this. The PIN did the trick and I have used it since. At 27 Mhz Low cost relays work great, for as the cost of pins they are a little higher but when needed it is worth it. For as the bias yes it takes some time to find the balance point for it to track, but in some cases it is not worth the time to do this, as the time can be quite involved to get the proper temp measuring Diode and other circuits to work together. At least you did use a regulated source for your bias.
Keep Building.

It's not exactly the same thing. Incidentally, there is no such thing as "type" acceptance anymore.

While radios for other services have to meet certain technical standards for sale and use in
that service, Amateur rigs don't have to meet the same standards. For example, a radio being
approved for CB service has to be "channelized" and have no "VFO". Power is to be 4 watts
AM and 12 watts SSB. While it is misleading to say that Amateur equipment doesn't have to
be "appproved", actually it DOES have to be approved for sale in the US. For example, if
a proposed Amateur rig were to be able to cover all Amateur HF bands and transmit on CB
out of the box, FCC would nix its sale in the US. The standards (VFOs vs channels, power
requirements, and bands covered) are just different. Therefore, you are right.

Amps are not evil but they do rank about #38 on the priority list for anyone who knows crap about radio. Peronally I have never run more than about 350 ever. More than 150 above 20 MHz is plain stupeed.

I have said many times that something in the 25-50 range makes more sense than 4 when the band is closed. That was about all you could wring out of a 2E26 in a Gooney box and it had a Heising system that effectively limited modulation to about 70-80%.

An amp is simply no substitute for operator skill and recognition of power needs along a path. It is no substitute for a decent receiver. It is no substitute for a decent and directional antenna system. It brings with it the responsibility to maintain correct drive levels and not try to squeeze the last watt out of it for 6 inches more deadband range.

To get worked up over amps is simply to be a backward cap, pubic hair on the face, knuckledragger.

It ain't us Old Timers or for that matter the FCC that is holding up the march to a codeless testing environment. It is that the master treaty for radio internationally DEFINES an Amateur as knowing Morse Code, the infamous section 25.5. This will be true at least thru 2003.

Learn the 5, it might take you a month. The Boy Scouts required 8 for the Signalling merit badge.

The usual 3 sites:

http://www.arrl.org
http://www.qrz.com
http://ah0a.org for Morse Academy so you can learn on the compooter.

The next step is eliminating any 11m equipment being sold. The vast percentage of the public already get what they need from a radio service used for personal communications by using either FRS or GMRS radios. The need for 11m as a personal communication band is no longer needed. As long as it continues to be abused that is just more incentive to eliminate it for public use, and turn it over for industrial uses.

well twist....houston has been known as the tiddy bar capital of the
world, and i have gone to a few in my time..and it may come as a
surprise to you, but most of the women that work in those places hate
men......so tell me...why would a man go to them......hell those women
get in the bathrooms and talk about what chumps the men are, and how
much money they are screwing them out of....hell i have seen those
women take a mexican and drain him of all of his wages for the week
and as soon as he is empty he is told to leave and if he doesn't he is
thrown out......you know, i sure hate seeing a hard working man, get
the short end of the stick like that, but it does happen.......no sir,
.if going to places like that is your bag, then go to thailand or
mexico....at least you will get to buy what you are looking at.......i
learned a long time ago, that you never get a hard on, unless you are
about to use it......head is out.....

> Here's a bare face lie.

Really, Your proof is? Do you make a habit of lieing? Wait I know the answer to that one. How would you know whom I have talked to or not. I seem to forget you guys know it all and whatever you say must be the truth right. Kinda like twisty used to say just because you say it doesnt make it so. What need would I have to talk to sparky, he takes care of himself without any help from me so ask him if he has ever conversed with me or is he a liar too? Kinda funny every one lies except the guys doing the accusing with out proof of course.

> Like you said I'm STILL using it. Encryption pissed on your parade,deal
> with it!

So you call hiding behind newsreader.com encryption? you call using a hotmail account encryption? I thougth you guys called people like this trolls. Thats right when they are doing it it is ok for all others different set of rules.

btw, my name is george right? You guys said it was, so I guess it is true huh.

Aaron, here is more Tim is a asshole, so is Moped Steve, so is Landshark so is twistedhed, they lie and make accusations with no basis for proof. When I accused someone at least I can attach an ip address to a post that all the proof that is needed theses guys have attached allot of Bs to the posts That is all they have since they cannot justify illegal behavior so you see they do have much in common.

Answer: Don't ask technical advise from Moped. If a radio draws less than 5 amps why would you use a 20 amp fuse for starters? Reread his post above before you try to give technical answers.

Because the Amateur power limit at the time was in terms of input. The FCC noted that it was the only service with that sort of limitation, went to 1500 PEP out. This had the rather odd effect of increasing the limit for digital, CW, and sideband but cutting the level for Ancient Modulation roughly in half. But by that time Antique Mary was pretty dead anyway.

do a google search you can see that this is suckass/middlefinger. you
will see that the same person was posting from aol at home comcast to.
what a fucking asshole trashing this group with all that shit for
months now

2844. Just as info.

I don't know if this was posted here, but I just thought I'd put it in. It is info only, and there
are no insults or flames meant. It cannot even be related to CB. Again,it is just information.

FCC AFFIRMS $10,000 FINE IN AMATEUR PIRATE CASE

The FCC has fined a Texas man $10,000 for transmitting without a license on an Amateur Radio band. Following a Notice of Apparent Liability issued in September, the FCC affirmed the $10,000 fine in a December 26 Forfeiture Order to David Edwin Merrell of Wichita Falls. The FCC said Merrell did not respond to the NAL.

In its earlier NAL, the FCC said it was acting on "numerous complaints" from the amateur community that an unidentified station operating on 7235 and 7238 kHz in the 40-meter band was causing "intentional interference to authorized communications." The FCC's High Frequency Direction Finding network determined that the signal was located in the Wichita Falls area.

Last June, agents in the FCC's Dallas office monitored an unidentified
station on 7220 kHz and determined that the transmission was coming from Merrell's residence. "The station did not identify and transmitted only one-way broadcasts," the FCC said.

During as station inspection, Merrell "admitted to the transmissions and stated that he did not have a station operator license," the FCC said. Unconfirmed reports to the FCC indicate that Merrell may have continued to occasionally transmit on 40 meters following the FCC visit.

"Considering the entire record and applying the statutory factors listed above, this case warrants a $10,000 forfeiture," the FCC concluded. Merrell has 30 days from the date of the Order's release to pay the fine. If not paid, the matter could be referred to the Department of Justice for collection.

2845. Re: Good inexpenive under 300watt Mobile Amp?

Galaxy 250 (blue face) amplifier for sale. Good for 10/11m. Used once!
It is perfect. $100 US or $165 Cdn and I will ship.

Moped, what is this you are trying to prove, that I posted from my @home
thru mailgate?
Of course I did using my same @home account that i always post from, In case
you are wondering the info on this account was emailed to me. And since you
know @home's NG are suffering from the transition to Comcast.
From what I gathered it sounds like it may be a group account since whoever
BadBoy1 is he must have signed on with it too. But like I said earlier I
havent posted from google or aol, unlike you that is. Yes indeed do a google
search by al means, bring to light all these posts of mine.
Is this all you have got for a guy(me) who supposedly screwed up the NG for
months. Is this the best you can do?

> do a google search you can see that this is suckass/middlefinger. you

Yeah but Steve he has this fancy software he uses to design this stuff he must be some hi level engineer somewhere. I mean Steve he told us he knows what he is doing. Maybe he is a little older and they didn't go over this stuff when he was in school.

Maybe so, but using fancy software is one thing, but using that information from it, and making it work is another. Called hard knock experience!

2852. Cable Modem customers

I know this has nothing to do with cb radio.

I am thinking of going to a cable modem service, I've heard that Comcast is handling it in this area... are they any count? do they suck? or what?

thanks...

OHPM

Selling a 148 GTL modified, mobil bracket, original mike and power cord. The unit is a 8.5 out of 10 aestheticaly and works great on AM and SSB.

Will provide a picture of the radio if interested, asking $140. and I pay for the shipping USPS First Class insured.

E-mail me for more details on this radio.

Gil

I am not too familiar with Comcast and their services, but I have friends who use Adelphia amd Roadrunner and they are very happy. If it was available where I am I'd jump on it in a heartbeat, this 56k is slow, but then..... I can remember running a BBS on a 300 baud modem heheheh.

If bought in sufficient quantity, no.

I have heard of people using standard diodes as well, but I never tried doing that. I guess in theory, forward bias a diode, and it will pass a sinewave unobstructed.....

Don't some amps get a little heavy to be held in the breeze by a magmount?
One way to cool the amp I guess.

If you plan to run the amp into the antenna, can I watch?? I will hold
the fire extinguisher but I absolutely refuse to tell anyone the paint was
scorched by a meteorite. Watching the amp reduce itself to ash might be
spectacular as well.

Plan to sell tickets???

I've talked with a few of them - and haven't said anything about the use of 'preferred personal' - nor anything else for that matter. I'm not sure what an 'AM'er is supposed to sound like, but quite frankly why say your 'handle' is or 'preferred personal' or whatever when you mean your name? BTW, back in the 60s it seems like everyone used 'handle' - but probably backed off it because the CBers started using it. Not sure what the big deal is as far as that goes. The going into other services, to me, whether by CBer or ham, is a NO-NO. I believe it was Scott (Unit 69) - or maybe even Twist - that said as long as you don't intentionally qrm others, you won't likely have a problem. I can't argue with that.

Oh, I couldn't pass it up. Yes, a tuner will work (I didn't see Dave's post as I currently have him blocked - not that I dislike him personally, but the commie stuff got to me). There also are broadband antennas. Try discone, biconical, rhombic, or log-periodic.

Wilson uses RMS watts when rating their antennas. You shouldn't have any problems with that 250. A good radio might get 250 watts on modulated watts.

Jason, I wish I could find the article warning about buying other than name brand coax. The stuff may be marked RG8U or anything - and be twice as lossy as the real McCoy! Know from whom you are buying.

Ok.

> Why would a ham want to use FRS?

Maybe they are board with the same old hum drum ham stuff. I find the HF frequency that there listen to in the background, and give then a call, its quite funny!

These old guys are having a ball. We record each other for the Saturday morning breakfast show and tell hour, it a gas!

> My
> 440 HT with six double a alkalines has worked Australia through a 10 meter

Not a big deal really. Who cares. I am supposed to be impressed?

> None of this is possible on FRS frequencies.

You don't know whats happening out here with all the FRS, GMRS, and Ham stuff. There's no telling what your gonna hear. Thats why the scanner is such amusement.

I have a guy about 20 miles away with his Station Master, his 440 rig and he talks all over. Loud and Proud.

> Of course, considering how bone-dumb stupid

> repeaters.

Nope these are old fart call signs, WA6XXX. I think you need your crystal ball re-calibreated, or new batteries.

I know guys who you couldn't give a Ham Lic to, for all the snotty and unfriendly people on the frequencies, a real pity!

> Why would a ham want to cob up his gear and possibly render it
> less effective where it was intended to be used?

If they have any technical abilities, they will not render anything, or
disable any of the radio equipment.

> BTW, the use of CB slang has increased a bit. Most likely a result of more CBers getting
their ham ticket. As stated, the exams are very simple. Way too simple (no, I am not
talking about Morse here).

Without having hands-on on this one, my friends in the biz tell me it is common to use Radio Shack coax in paging applications in tall or wide buildings precisely because it is 'leaky'. Seems the real leaky coax designed for the purpose costs too much.

Next time you see a coax hanging down an elevator shaft see if you can see who made it.

Back when 1x2 calls were new, several of us would get on two meters and do
the CB lingo thing just to jack up the more anal types. It is, however,
mildly hilarious to hear two ex-AMers run into each other on a repeater
and neither one of them will give a name and QTH; vaudeville is not dead.

Pin Diodes don't work well enough at 12VDC to even switch the legal output of a CB set.

If you wanted to use them their forward current rating would have to be higher than the peak antenna current and their applied forward bias voltage would have to be about 20% higher than the highest expected peak voltage at the crest of the modulation envelope.

I suppose you can use a DC to DC converter to get the high voltage, but diodes that could linearly handle the antenna current would indeed be pricey.

You are walking a very fine line Dave. It's called a rhetorical question.
Which means the question has the answer built into it.

It has nothing to do with going to a "State Church" but in reading the
Bible. ALL OF IT and not just the little tid-bits you get on Sunday
Morning.

Like I have said many times, you SURE know a lot about the Communist Planks.
Are you sure you aren't a closet commie? You seem to know much more about
what Marx wrote than about what is in the Bible. Remember, It's just a
question.

Kevin, WB5RUE

NO, it didn't "change" over time. Just some old english revised. It didn't have SODOMITES on it's board when written like the PER-version (NIV). It with the Geneva Bible are the most accurate with the received text, not the perverted "Alexandrian" text.

You see 4 to 600 watts out of a Galaxy 250? Wow. You must volt a lot.

If you try to push a galaxy 250 to 100 to 150 watts (a fairly broad margin,
200 peak
watts) it won't last long, and will sound like poo poo.

Otherwise, Hes right, it won't like that antenna for long.

Toll_Free

Hello Jason: I had to repair a Lil Wil for a friend, a few months ago.
It has a coil with small gauge wire and a small low voltage capacitor.
The antenna was made for low dollar installations. Not power to the
tower type installations.

I'd say 250 is pushing this antenna. Suggest a better Wilson Antenna
such as the Wilson 1000 or 5000.

Jay in the Mojave

Thanks guys for the advice:)

Hey SuckMyAss.... I can see you know how to use dejanews ... wow i post about the XBOX o00oo0o00oo0 the secret is exposed!!! LOLOL

I can ask what i want and asking is breaking no law..... and yes this is a CB newsgroup..... so why are you here?

Also I do know alot less than most here... thats is why i am ASKING the questions opposed to answering them....

I'm not threatening you... I have a lot better things to do with my time... opposed to you who things flaming people for not being as keen as you on certain things... or people you thing are breaking the law.....

I'm not new just been out of the game for years..... and if this is your way of trying to prevent people from breaking the law it sure is a failure...

Why don't you try to enforce the law in the real world... not in some NG.

Bottom line say what you want to say... and try and show me and the rest of the NG that you are much more versed in this than I and that you are so righteous and law abiding.... I don't care.. i know where I stand in this world and have a good idea where you stand... and I like it over here a lot better...

So keep trying to 'enforce the law' but i know i do more in one week with making the world a better place than you've probably done to date....

I really think you need to get a life and find something more productive to do with your time.... and

Dave got me. He copied to my e-mail addy so I got it anyways. So, rather
than extend the block to e-mail, I unblocked him. It can be amusing. So,
who is Stuart Crane? Any relation to Wayne Green?

Although I will admit that Morse is antiquated, I must admit some curiosity. Although I realize that one can transfer megabytes across the internet very rapidly, I am curious as to how (other than digital cameras, scanners, or just cut and paste) the information gets into the internet. You and I are posting. We have to type. For the record, I used to do solid copy for several minutes on end - no error - put on paper - both plain text and cypher groups - forty words per minute in the Navy. That was the fastest they could test at Bainbridge. I could go a bit faster (not much) but am curious as to how fast you type ..... oh, one other point (not that I'm trying to make a case for Morse, but this could be a case for digital modes such as PSK) - if you are transcribing from a voice contact to paper (say names of victims at an accident scene or needed supplies), how often are you going to need to ask for the spelling? Using the phonetic alphabet with voice will be one HECK of a lot SLOWER than CW - and that will be slower than a number of the digital modes.

Thanks Toll! I've been considering either the 3 Mbps DSL (at $40.00 per month) or the slower 256 Kbps DSL (at $26.95 per month). That link will help a lot of folk. Although perhaps a tad off-topic, this is a post that, for a change, will actually help some of us!

No, I wasn't. I was telling the OP that he -could- wrap it around the
mast if he wanted to, but that it might be easier or better to run it
-inside- the mast. You were either not paying attention or you were
just looking to nitpick my posts again.

>That's all I was trying to say,

No, it wasn't. I was clear that you were trying to say that I didn't
know what I was talking about; but once again you failed.

1) Don't you worry I won't be in your area.

2) I follow the law and don't make it a habit. I have not used any illegal radio equipment either.... I just want to know more about it forst. Although I don't do anything against FCC regulatiosn I personally don't think it is such a big deal and think other laws need to be enforced and policed A LOT more thant CB wattage.

3) Yes its your god given right to advocate the law so preach on.... I am a law abiding citizen as well.

4) I will not name my'accomplishments' that does not mean i don't have any I just don't think sitting here naming some is called for..... I do charity and humanitarian work when I can as well as donate to several worthwhile charities (no charities that enforce CB FCC Regulations tho i'm sure to some that would be worthwhile I just think there are a lot more important things to worry about).
I do nothing that will make me a martyr but I do a lot of good in this world.

In any event I really don't want to aste my time bickering back and forth.... I know your point of view and you know mine...

Jay, I can see how you could misinterpret my post. I've never said anything when someone tells me his 'preferred first personal is' - other than give my name and continue the QSO. The tests are too simple as they are published in Q&A manuals and the way questions are worded, often you don't really have to know anything. I have no problem with newcomers - all of us were at one time or another. I get nervous when I see an article where a newly minted ham gets electrocuted (within a month or two of getting his ticket) putting up an antenna too close to a power line (and they touched). THAT is my concern. You also can't really tell who is or isn't an old timer since they opened up the 'callsign of your choice'. You may well have a 1X2 call extra class who has only been licensed a few years. It is likely all of the original 1X2 callsigns are long dead. Of course, a WA or WB callsign is very likely an old timer; however, many callsigns may have been reissued during one's amateur career. Let's take, for example, one of the AA or AB calls. This could be a result of an upgrade to extra by an oldtimer, but suppose it isn't a result of an upgrade? How long do you think a callsign such as, say, AA2QA might go back, given the call was not the result of an upgrade (IE, new ticket)? New guy or old timer? What about a 1X3 callsign? Again, those should be REAL old (back into the 50s) - except, again, a lot of those callsigns were vacant when the callsign of your choice came into being. As far as not cobbing up the gear, that surely is possible; however if you think that there aren't more than a couple of amateurs a few bricks short of a load, I've got some ocean front property in North Dakota I'd love to sell you! ;-)

73 from Rochester, NY
Jim
ps - I've worked on VHF/UHF/trunking radios. I would not attempt to modify any radio WITHOUT proper equipment. Proper equipment does NOT mean a dummy load, SWR/power meter, and dvm only.

Hardly. SSB takes 1/6 the power of AM to transmit the same
information. An SSB will easily outperform an AM transmitter of the
same power. There will also be a -real- (not "seemingly") increase in
range because of the reduction of the noise floor.

>However, in <<actual>> use, with typical CB type radios, it is another
>story.

Toll, the story teller.

Jason, here is a list of the things you do daily to make this world a better place, DRUGS. Thats why you don't care about being Illegal with a Cb radio.

****
**

From: Jason (jbell1@optonline.net)
Subject: CRSB/Tom Kasper? Any1 remember?
Newsgroups: alt.drugs.chemistry

Hey all,

I used to frequent this newsgroup years back (formerly used the screename and email of Rebelins36) Anoyhow I was just wondering if anyone knows what ever became of him, his company and the whole situation.

i'm just curious since i'm just reecently back onhere after some long inactivity and just remebered CRSB :)

thanks all,

J

From: RebelINS36 (rebelins36@aol.com)
Subject: Morphine 200mgs. Need advice
Newsgroups: alt.drugs.hard

a friend has a handful of these puppies and I just wanna know a few things. Will one 200mg. pill really f*ck you up?? (i'm about 6'1 and 155lbs) Also, is
it true breaking them in half is dangerous due to the time release properties

of the pill? Now i've had a lot of expierence with herion (none recently
but a
few years back) how similar will a 200mg. pill of morphine be to that and/or
how dangerous?

Thanks,

RebelINS36

From: RebelINS36 (rebelins36@aol.com)
Subject: Meth and Opium.. Around here at all??
Newsgroups: alt.drugs.hard

I'm curious as to where Crystal and Opium <smokable opium> are readily
available? I take it Meth is probally most prevalent throughout the
mid-west-west coast, not sure about opium. Anybody know how availible and
where
so available around the new jersey/new york area?

thanx

J

LOL 0o0oo0o00o You are so very good with NG finders you deserve a hand!

I have used drugs before but none of that.... I inquired about it out of 100% curiosity... and thats the truth whether your self-righteous self believes it of not.

and if you believe people who may 'break the law' here and there don't lead good lives and actually do more good than bad than you have more problems than I thought:)

Bottom line is I really don't want to bicker back and forth.... so please pull up old NG's ... I can care less and have no issue with being curious about things legal and illegal... I have nothing to hide my friend because if it did it would be hidden.... I follow a fully law abiding life now and whatever you think is fine... I lead a life that i have no problem with and hurt no one... so whatever you think is fine...

This is a CB NG and I will continue to use it for that so have posting my old messages they are of no bother to me...

>(This means HEAVY cable for your DC requirements!)

The word is "precautions". Many years ago I think it was GE that had a problem with their (<100W) radios locking up the anti-lock brakes. RF can interfere with important safety systems in modern vehicles, and they are tested at the factory for a maximum RF power with various installations. Exceed that power and you are taking your chances, not just with your own vehicle and passengers, but with any nearby vehicles that might be affected.

>All installations should be checked for possible interfer-
>ence between the communications equipment and the

Not so, even ONE volt canl switch 2.5KW or more of rf power using only one high power PIN diode. Remember the diode at 100 -250 ma of forward current at .75 volts drop is equal to only .3 ohms, and at 500 ma .9 volts drop is equal to .1 ohms. This is the RF resistance the RF sees and is a very low loss RF switch. Even relays can have more than this at the 27 Mhz band from inductance loss. Check around, ALL commercial two way radios now days from the small 2 watt units to the Police, fire ect, 100 watt radios are now and have for years used one or two Pins for their switching to the antenna.

Greetings!

I'm suprized that more amp makers aren't using the PIN/Limiter to help reduce RF overload. It sure would have helped me and a lot of other neighbors.

In regards to CB's and the likelihood of failure...
Thats depends on how the engineer designed the "front end" RF amp section. A little understanding of how this works in a CB can help others understand the issue of using PIN versus a relay.

The relay, in any amp, can cause more damage than using a PIN diode on the tap at the output of the amp for RF-bypass. Simply use a low value cap on the input side of the PIN section. You'd be suprized at how well the radios receiver can adapt to it. It doesn't take a lot of capacitance to pass RF. Just the amount of current it will allow. Which is what you want to control, right? Simple disconnection of the RF line, you still have RF that will pass thru the relays contacts. The relay controls the DC side of things, but they don't have true RF bypass capability. They will still induce RF into their open contacts. Using a relay doesn't guarantee high-power isolation from the RF.

To help...
Pin diodes are used in a simple AM CB, many just don't recognize them.

They can be a simple Limiter on up to a biased conductor.

An FET based front end in a CB is at the mercy of what is present. Due to the insulated gate junctions, you have more of a static problem than an RF input one. [Hint: Arcing and the heavy harmonics produced] Discretes can be arranged and biased, even with their low reverse breakdown voltages, to handle a considerable amount of power even when their leads are unpowered.

The use of diodes simply allow for the clamping of excessive RF voltage, that if excessive, would damage the RF amp in a typical CB.

Depending on how the engineer designed the receiver, the RF pass cap and the PIN section, along with the inherent rectified DC voltage that the pin diodes present to the front end, simply "swamp" the RF coupling and tuning coil. Audio information and DC bias are immediately shunted thru the tuning coils' low resistance to DC and audio - into ground.

When a PIN fails, thats when things get interesting. What causes them to fail is excessive current, a shorted cap, or an open winding in the RF amp coupling coil.

I've worked on radios that even use 1N60's as self-starting RF limiters for sensitive receivers. And they've never been damaged. The way the engineer puts in the clamping part of the circuit into the whole picture of the receiver, makes or breaks a radio.

I would like to know why people are so concerned about PIN's failing. If they are designed correctly, and the RF bypass cap has a low enough value, these designs can take a lot of RF, except for a direct lighting strike, before they quit.

Due to the input impedance level of the CB's RF amp font end, you'd be hard pressed to do any serious damage to any front end. Unless the engineer designing the circuit, took the day off when it was prototyped.

RF engineers place low value capacitance as the coupling cap to limit current, and many CB radios have 1N4148's back to back as Self-Starting limiters, which replace the PIN diodes quite well. To DC the input impedance is extremely high due to the blocking cap. As you raise the frequency, the input cap will still show a high input impedance.

Anything less than the breakdown rating of the cap will pass, and the PIN/Limiters provide a .7 to 1.1 volt across the circuit under full RF exposure. It simply "pushes up" a DC bias into the coupling coil or cap. Since the coupling coil provides isolation [separate windings and a tuning slug], the output side simply sees less RF due to the swamping of the input side of the coil or the cap before the coil with DC and rectified audio.

Perhaps you're getting the "overload" issue confused.

When the PIN or Limiter section conducts, a small rectified current is generated within the circuit. Since the cap is only passing RF current, it's blocking the means of escape to the "bleed-down" static resistor in a CB. This current has to go somewhere, so it drains off thru the RF amp tank coil winding, if the CB uses a blocking cap to the coil, the diodes own internal resistance.

To some radios, strong RF is a buzzy audio scratch you hear thru the speaker from a local a wee bit too close to your antenna. It's the radios way of letting you know it's trying to do it's job. Even strong local EMF from sub-stations can do more damage to PIN diodes, due to constant exposure and these diodes are conducting nearly all the time. You may not hear it, but the RF amp does.

In some radios, an RF coupling cap of a larger value is present, past the limiter/PIN stage. In these designs, the PIN diodes will self-destruct if rectified current is excessive. These cap/PIN/cap designs can also provide a good level of protection, the only thing you have to worry about is the breakdown voltage of the caps and the current capacity of the PIN's.

Adding in a 1K to 10K resistor across the PIN/Limiter diodes in a cap/PIN/cap design will help reduce the static and RF buildup that can occur, with little detrimental effect on receive. It's just something the CB makers left out to save costs due to the power levels present in a *normally* operating CB radio. They simply don't need them unless you're going to run two CB's on the same antenna, and even that is pushing it. A final would fail quicker on a CB operating a linear due to the EMF kickback of a poorly designed amp. The use of a 36 - 50V zener across the "bleed-down" resistors should be used versus the worry of a PIN diode failure, you can lose a lot more if you're ignorant.

When dealing with the coupling coils, these windings are quite large in the number of turns, and AWG is considerably small, the current it can dissipate is limited and they will fail. When that occurs, you have a cascade event.

Just simply plan ahead. Adjust the CB's input capacitance to the RF amp stage to a lower value, check PIN/Limiter action on an oscilloscope while looking for "jumps", and apply a bleed-down resistor across this section to ground if necessary. No big deal.

The above trick causes a slight loss of receiver sensitivity, yes, but you can lower the noise floor and improve selectivity at the same time. Let AGC do the rest. The resistor value needs to be in that range so at least one of the PINs is allowed to conduct. You simply need the resistor to provide a shunt in parallel to help reduce current passage when they rectify.

The only drawback is the presence of 2nd and above harmonics, PIN's have a frequency response curve, so use diodes that have a wide bandwidth to handle the spurious. Due to the inherent nature of the caps, they too will allow more RF current to pass as frequency increases. What appears as 10Mohms impedance at 1MHz, can appear as 1Kohm at 27MHz, and nearly 0 ohms at 52MHz and above.

Putting in PIN diodes and adding in the "shutoff" safety on any amp should be a *requirement*. Let the relay handle the pills, and not have to switch in or out the RX line. Keep RF out of the relay, and let's all go home.

Besides, running an AB-biased amp *increases* it's sensitivity to RF versus a Class-C, so PIN diodes are a necessity on such a high-power device to protect the amp itself. You'll find the design is far easier to work with in making the amp linear and stay on it's curve. You simply pre-set the input level and if done right, you won't need to "swamp" the input to the pills.

It simplifies things. Hope this helps ... knowing how a CB's RX RF input side is designed, you can make allowances for the use of PIN's in any amp. The trick is where to put PIN's and hooking them up.

Getting rid of the Morse requirement for the HF bands. I second that motion!

Here's why. Years ago people used to beat very loud drums to communicate over very long distances. Some even used smoke signals. I cannot I imagine a situation where I would have to use either one of those methods to communicate. Nor can I see any use for Morse Code with today's available technology.

Having Morse Code as a requirement for HF privleges is analogous to requiring the knowledge of how to saddle a horse in order to get your drivers license. As far as you CDL endorsed guys out there, you'd have to learn how to hitch a wagon.

I mean, what's next? Having to make a telephone out of two tin cans and a string in order to get a computer networking degree from Duh-Vry?

It serves no purpose at all. Why bother knowing how to transmit 13 wpm when you can send data at WAAY faster speeds halfway across the planet in under 300ms?????

No - wait. Let me think about this. Here are the only possible scenarios I can imagine that justify Morse Code as a requirement for HF use.

1.. If the commies attacked and most of our transistors were blown from the EMP then the old tube rig would be the only thing that would function as I'm hiding under my 1950's desk / emergency bomb shelter.

2.. What if the earth crashes into the sun? The solar flares would knock out all of our communications satellites for sure then! Tubes would be the only option!

3.. Suppose those Aliens that call into Art Bell from the future decide to attack earth with their super magneto ditigilator distructor beam weapon?

I'm running short here on Ideas for "HYPOTETICAL" situations where I would actually need to know Morse Code, smoke signals, or pound on some very loud drums in today's world. Feel free to contribute to the list!

Dunno... Nostalgia? That seems to be the only purpose for it.

Thank you, Andrew! This will take a bit of time to seep thru but it is the first sense I have seen on the subject. First thing is to find out how TenTec does the QSK CW schtick.

Given the number of CB antennas run above DC ground the static protection issue is there almost regardless of the transmitter's presence. Some of Sony's SW receivers are well known for blasting FETs. Wonder if that is one reason CB receivers are by and large cruddy.

I say before we get em' weened from Morse, we're gonna have to wean them from that "Peace and Love / Ghandi" trip they had a few years back.

Then after that societal epiphany brings em down we can explain to them why it is that then are complaining that they don't have enough people involved. But, that's their generation. Feeling with their heart as opposed to thinking with their brain.

It's get's scary when they vote with their heart too. Then they start to complain and say to abolish the electoral college to get their man into office. You should have seen the looks on their faces when I explain to them that we would have to get rid of the House of representatives too! I mean, after all. Is it really "fair" that California gets more votes in the than say Kansas?

But don't underestimate the "liberal arts" graduates. If you come across one of these little monsters, be sure not to answer a question they ask that has a forgone conclusion.

>Dunno... Nostalgia? That seems to be the only purpose for it.

The real reason why some applaud the CW requirement is that it is
a territorial tool to exclude others. Most of the "others" understand
the out datedness of morse code and won't bother entering this
outdated world.

Meanwhile amateur radio keeps on faltering like K-mart. It's time
to wake up and get rid of the outdated requirements for licensing and
replace them with updated digital requirements.

Faltering?? Modern digital?

What is digital anyway? It is Morse except that it does not take wetware, just money and lotsa spectrum. Agree on a coding structure and beep away. What's the diff?

Multi-channel? Look up duplex TTY and it had the same problems as for that matter did Touchtone. You have to select coding freqs that do not intermix to something that is supposedly information. No digital broadcast system yet is capable of staying in its assigned bandwidth; we laughed at Japanese analog HDTV systems that required 20 MHz channels and put in a digital system that takes 30 when it works at all. Digital AM takes close to 50 and the LA fire dept is zonked by cellphones wandering all over creation. Some update.

Most of us are ready and able to see the end of code testing, far more so than those who sit on the sidelines and mewl about an exercise in Nintendo and just about as difficult.

Tnom, just who in hell do you think you are kidding?

A doable endeavor. But how would you eliminate those using modified
ham gear? If you ask any "old school" freebander, they'll tell you
that the "classic" freebander's rig was the FT-101 series...and
subsequently the FT-757GX. (The TS-140S had its share too.)

> The vast
> percentage of the public already get what they need from a radio service
> used for personal communications by using either FRS or GMRS radios.

This is an interesting statement. Who decided what the "vast
percentage of the public" wants in the form of "personal
communications?" You, me, the FCC?...nope. The "public" does. Just by
virtue of the expansion (albeit contrary to FCC rules/regs) of the
11-meter band, I'd say they've spoken loud and clear. This is just not
in band space either, Leland. Large (& pretty well organized) DX
groups, contests, activations, awards, dedicated logging software,
etc... I agree that there should be some damage control, but that'll
take compromise. (I don't see that happening anytime soon.)

> The
> need for 11m as a personal communication band is no longer needed. As long

The rating they're giving is "inflated marketing". It refers to the power (DC)necessary to get maximum output from the amp. Remember that amps of this type are probably only 50% efficient so when everything is said and done, you can probably only realize about 60W RMS RF power.

A mother, accompanied by her small daughter, was in New York City.
The mother was trying to hail a cab, when her daughter noticed several
wildly dressed women who were loitering on a nearby street corner.

The mother finally hailed her cab and they both climbed in, at
which point the young daughter asks her mother,
"Mommy what are all those ladies waiting for by that corner?"

The mother replies, "Those ladies are waiting for their husbands to
come by and pick them up on the way home from work."

The cabby, upon hearing this exchange, turns to the mother and
says, "Ah, C'mon lady! Tell your daughter the truth! For crying out
loud...They're hookers!"

A brief period of silence follows, and the daughter then asks,
"Mommy, do the hooker ladies have any children?"

The mother replies, "Of course, Dear, where do you think cab
drivers come from?"

Honestly, I can't say that I remember that one...

Speaking of old Commodore equipment. anybody interested in buying some? I have a ton of the stuff, still functioning (at least the last time it was hooked up). Have, I believe, 6 Commodore 64's (4 old style, and 2 the newer "64C" style), 3 1541 drives, 1 1571 drive, two printers (One thermal color, one B&W 9-pin dot matrix). One 1200 Baud modem, and one non-functioning, though repairable, 2400 baud. Shit loads of software.... Joysticks, mouse, books, about 6 or 7 years of magazines (Compute's Gazette, RUN, etc.)

The second step to eliminate 11m abuse would be to fill it with the
emissions of a large amount of industrial equipment. For example there is
one frequency right now in the H.F. bands used for industrial use, and that
is 13.56 MHz. Relaxing the harmonic content of the equipment, particularly
the second, allows more junk right in the middle of the current 11m band.
Once 11m is full of obnoxious industrial equipment RF emissions nobody is
going to want to operate there anyway, thus even the demand for modified Ham
gear that can operate there will drop off too.

> 11-meter band,

If you really take the time to monitor the 11m band much of the
communication is not of the "personal" nature, i.e. family members staying
in contact with one another. Even the more vocal members on this group don't
make the claim they use 11m for personal communication for the most part,
otherwise why would any bozo need a KW plus amplifier just to talk a few
miles across town? No, the most use purpose of the 11m is a "hobby radio"
band, which by the way is what Ham Radio is for, and was also the main
reason why the Alan Dixon request to eliminate the 155 mile DX rule was

declined by the FCC. The FCC stated in their reply it is NOT their intention to create another hobby radio service, which is what the 11m band has degenerated in to currently, but without the respect for regulations that one finds on the Ham bands.

Another reason why people no longer use 11m for personal communications are two, first is the large number of bozos on 11m, second is the equipment.

As anybody who has spent more than 10 to 15 minutes flipping through the legal 40 channels in a major metro area can testify about the rude, and vulgar nature of many of the communications you hear. Yes there are a few goods OP's out there, but sad to say many are not. You get the noise makes, jammers, channel control freaks etc. most of the time.

The equipment question is the more interesting of the two. V/UHF equipment by its very nature allows full sized antennas to be used, making more efficient use of transmitter power, and FM does a good job of eliminating much of the natural noise you hear using AM, thus the sound quality is better. Personally I have made contacts of over 10 miles using nothing more that my 5 watt HT on simplex to a base station.

Don't forget that there are 3 other radio services, other than 11m, that can fill the need for personal communication. Those are FRS, MURS, and GMRS. Right now you can go out an buy a 1 to 5 watt GMRS HT that can communicate with any FRS radio on channels 1 to 7, and it is legal to do so. One can run even more power using a base or mobile GMRS radio. All that is required is to pay a $85 fee to the FCC in exchange for a license good for 5 years. The MURS radios are license free, have 2 watts of output, and there are now several models available to use on the band right now. Just check out the Radio Shack catalog for this year. And finally most people on this group are aware of the FRS band, and the pocket sized radios one sees for sale just about everywhere now.

Any of the above three radio services, FRS, MURS, or GMRS, can provide all of the needs for personal communications in a small to large metro area without the need to even venture in to 11m. Considering the above I don't see any further need to keep the 11m CB band around, might as well put it to good use for industrial equipment since their emmisions have to go somewhere.

> I think we've had this discission before.

I think we have.

>Good luck! I pesonally don't
> think it can be done. But I'm always game for some entertainment.

Well think about the points I made. I don't think it is unreasonable. After all the FCC has now opened several parts of the spectrum for unlicensed use, and there is still the GMRS service, for a samll license fee, with the ability to use repeaters to think about. To clean up the problems on 11m would take money and effort, however pulling the plug on the sale of 11m radios, closing the band for communication use, and turning it over to

industrial uses can be done with the stroke of a pen. Which route do you think the FCC will take?

First of all this might help out.

When forward biased the Intrinsic region, between the P and N layers of the diode, has a large number of electron hole pairs and significantly lower resistance (at high frequency) than the Intrinsic material normally would. Also the reaction time of the I-material is low compared with the RF signals, allowing the PIN to be used as a low distortion variable resistor or switch based on the forward (DC) bias applied. Does that help now?

More Help on the subject: It seems like everybody is trying to compare
this diode with a standard one. They are different. Keep that in mind.
OK
A P-I-N diode (usually written as "PIN" to save space)
is actually a current-controlled
resistor. It's not like a standard bipolar, P-N junction
diode at all. A standard P-N
diode is an extremely non-linear device that turns "on"
quickly (forward conduction
mode) as a small amount of current is applied, and once
it's "on," it's on. However
the V-I curve (voltage plotted against current) for a
P-N junction diode is extremely
non-linear, making it a poor switch for RF purposes,
since RF is (normally) a sine
wave that goes through "0" (zero) volts with every
cycle; when swinging "negative"
(below 0 v), the diode will go into the "blocking" mode
and prevent current flow,
other than a tiny bit of leakage. Thus, almost no matter
what you do with DC bias,
the RF will cause the diode to rectify (which is what a
diode's designed to do) and
create its own DC signal from the RF applied, and due to
the junction non-linearity
the resultant output waveform will be very distorted.

A P-I-N diode has an added intrinsic layer separating
the P and N regions and acts
like a very linear, current-controlled resistor, making
a nearly perfect switch. Apply
some DC current, and the PIN turns "on," providing very
low resistance in both
forward and reverse directions (like a low-value
resistor). Reverse the voltage
applied, and the PIN turns "off," providing very high
resistance in both forward and
reverse directions (like an high-value resistor). Since
this is still a semiconductor
having no moving parts, it can switch very rapidly, even
thousands of times per
second, and won't wear out. At only 6W applied power,
quite small PIN diodes can
be used, and they only cost a few dollars each.

I found a PIN Diode at RF parts for $5.95 that can switch several 100 watts just to start. Some PINs were listed for $3.00 that could handle the input power going to a amp, so for $14.95 total (one High power diode for the Amp out, plus three others to switch the rf around the amp in the receive mode) is close to a good priced relay.

I've talked with a few of them - and haven't said anything about the use of 'preferred personal' - nor anything else for that matter. I'm not sure what an 'AM'er is supposed to sound like, but quite frankly why say your 'handle' is or 'preferred personal' or whatever when you mean your name? BTW, back in the 60s it seems like everyone used 'handle' - but probably backed off it because the CBers started using it. Not sure what the big deal is as far as that goes. The going into other services, to me, whether by CBer or ham, is a NO-NO. I believe it was Scott (Unit 69) - or maybe even Twist - that said as long as you don't intentionally qrm others, you won't likely have a problem. I can't argue with that. 73

Don't waste your $$$ on Wilson. I have better antennas around $55 or less
for the mount & the antenna. E mail me for details.
Dave!!!!!!!!!!!!

well twist....houston has been known as the tiddy bar capital of the world, and i have gone to a few in my time..and it may come as a surprise to you, but most of the women that work in those places hate men......so tell me...why would a man go to them......hell those women get in the bathrooms and talk about what chumps the men are, and how much money they are screwing them out of....hell i have seen those women take a mexican and drain him of all of his wages for the week and as soon as he is empty he is told to leave and if he doesn't he is thrown out......you know, i sure hate seeing a hard working man, get the short end of the stick like that, but it does happen.......no sir, .if going to places like that is your bag, then go to thailand or mexico....at least you will get to buy what you are looking at.......i learned a long time ago, that you never get a hard on, unless you are about to use it......head is out.....

-

Haha! Yea bud, I know what ya' speak of. An old friend of mine who was a drummer shacked up with one of them "par-tay" gals from one of Joe's finest establishments. She had no problem with a girlfriend and he encouraged it as long as he was, um, shall we say....satiated by an invitation every once in awhile?

She was tolerable but most of her friends weren't..and like ya' said, they were mostly pissed off! If you're into serious drama each and everyday, it's a good move. She made the bucks and he made his bed. Lasted 2 years until she ran off with the bass player from a christian rock band..gotta love that karmic justice. He inherited some cash and went back to Long Island and now teaches music via private lessons at an old record store he bought and converted.

I was in a wedding back in 96 and the bachelor party was held at one of these fine, upstanding establishments...pure evil, I tell you.

wrote:

You are still missing the point. Professor has only a rudimentary
understanding of the principles involved. Consider one of his more
recent claims -- his "one-pill" amp. He thinks that if he uses a tuned
input and output (a totally new concept for him) he can get 80%
efficiency out of a bipolar device. Not only that, this device is
ground-biased and operating into the Class C area. While he admits
this fact, he claims that it's not operating far enough into Class C
to distort the RF on AM. When questioned on the subject, well, just
read what he has to say:

>Linearity is not "required" for AM as well...

And my personal favorite:

>Certainly the lack of bias causes some distortion... I will not dispute
>that.
>The real issue here is how much. The distortion caused by needing to reach
>the barrier potential of a bi-polar device when the input signal is
>relatively high is slight. Yes, if you were driving an amp at lower levels,
>the distortion would be objectionable. It's all a matter of degree here.
>When you drive a stage with several watts, the distortion is very minimal
>and is not detectable in the received signal on AM/FM. On SSB, where the
>carrier drops to zero during times of no modulation, then you clearly hear
>the "turn on" distortion of the device.

His previous amps used only a ferrite transformer for impedance
matching on the output, yet he claimed the "flywheel" effect would
smooth the Class C enough for "excellent" audio on AM. His designs are
almost mirrored copies of cheap amp designs posted on other sites,
square traces and all, without any regard for component placement or
DC isolation. And back to the relay issue, he was intending to use a
single relay to switch both the input and output of a power RF amp,
totally ignoring the possibility of feedback coupling.

Then he makes the claim that he is a professional VHF amp designer.

If you want to school him in PIN diodes when he can't even master
relays, go for it: some people have to learn things the hard way.

They're only illegal if you use them improperly. I don't condone
that...
Since they don't have a "single" use or application, you can't lump
these amps as being illegal.

2990. Best place to mount antenna on a pickup

Newsgroup: rec.radio.cb
Date: 2002-01-22 20:25:21 UTC
From: Bill Tolle <BillTolle@ExclusiveBuyersAgents.com>
Message-ID: <RUj38.4423$kj5.1679883415@newssvr11.news.prodigy.com>
Source record: 113276

I have a Nissan pickup and need a CB antenna. I park it in the garage so I have a clearance problem, only 14" from the top of the truck to the garage door. I was thinking of mounting a Wilson FGT on the lip of the bed. With a 2' FGT it would clear the garage and I could exchange the 2' for a 3' or 4' when I am traveling and want better transmission/reception.

Is it better to mount the antenna in the center where it would be within 4" of the glass back window or the corner of the bed which would put it within 4" of the metal on the corner of the cab? Alternatively, I could mount it on one side of the bed farther away from the cab if that would be better.

The other alternative is to get a roof mount antenna that is only 14" high such as the Firestik DS 14 and exchange it for the Wilson FGT when traveling.

I don't need much range for everyday use but do want the best range possible when traveling.

I have read a lot of the advice on various CB websites but none of them seem to address this particular issue.

Any amp that is running 80% efficient has to be biased well beyond
cutoff. Zero bias won't do it, and you certainly cannot run AM or
SSB through such and amp with out lots of distortion. Professor
proves again he doesn't know what he is talking about.

and another thing you pussy boy, you seem to run so godam many fake
ids
i could only count these in the limited time i had today
mr middle finger 14
whoisgoerge 19
curioiusgeorge 58
snotrag useing comcast 3
steelgandta 15
snotrag useing at home 80
vobbner 108
for the rgand finnally of 297 in just a 3 week period thisis only some
of your fake names. you really are nothing more than a low life little
punk boy with no life.

3002. Exportradios.com experience?

Newsgroup: rec.radio.cb
Date: 2002-01-22 22:40:19 UTC
From: jlylew@aol.com
Message-ID: <ac51f598.0201221440.6abc37b5@posting.google.com>
Source record: 113288

Hi,
New to the CB world and I want to order a good setup. I attempted at
exportradios.com, but they have been very difficult to work with. I
finally sent them an email and this is what I got in response:

Yes, those are on back order, would you like to cancel the order?

-----Original Message-----

Subject: My order!
Hi,

I would like to know the status my order! It was originally placed
back
in middle December and then finally after the holidays without
receiving
it, I contacted you and I found out that you will not ship to an
address
that is not the billing address. So on the 3rd of January I placed
the
order again, this time with the billing and shipping address the same.
You promptly charged my credit card and I am now being told that you
do
not have any idea(this is from telephone conversations) when you will
be
getting in more of the radio that I ordered(Uniden 520XL).
HOW IS THAT POSSIBLE??? YOU HAVE TAKEN MY MONEY AND NOW HAVE NO IDEA
WHEN I CAN EXPECT MY RADIO!!!!!!! SOMEONE PLEASE TELL ME WHAT IS
GOING
ON!! YOUR WEBSITE SPECIFICALLY SAYS "EEI is a private venture
established to bring our customers prices, warranties, services, and
professionalism unheard of in this industry."
I cannot believe that your company does not have better shipping
records/accounting than that!
Sorry for the venting, but can you see my fustration?
Thank you,
Joe xxx

Comcast is a huge conglomerate out of Pennsylvania. They are one of the largest cable companies, they own the Philadelphia Flyers and the Philadelphia 76ers, and the Spectrum. The have a broadband service that covers many many states. Want to see the prospectus on them? Maybe you could rub a few nickels togther and buy a share or 2 ..... no doubt about it ....

Source record: 113290

Hi all,

I am looking to get a CB. I have heard Uniden is a solid brand and I am looking at the 520 XL. I will be using this in my Jeep CJ when four wheeling and also in my Suburban when towing the Jeep. THe reason for the 520XL is the size dimensions - it is small enough for me to be able to mount where I want it. Also, I have heard that a "tune-up" can help improve the performance. I am not looking for hardcore, just a reliable, somewhat powerful radio. Anyone have recommendations on where I can order one that comes "tuned-up" already? I am also planning on using a Wilson 500 mag mount on the suburban and a 4' Firestik II that I already have on the Jeep. This way I can switch the cb between the two.
Any advice, opinions, etc. welcome!

Joe

Have for trade your choice of a "President" Washington 40 Channel SSB Base Radio (the more desireable older model) or a Robyn SB-520D 40 Channel SSB Base (858 PLL) for a Texas Star DX-350HDV amplifier. Amplifier must be in new or like-new condition (Will also consider a Texas Star DX-250HDV). Both radios have been checked out recently by a tech and operating 100% per factory specifications. Both radios are cosmetically clean and virgin electronically (not modified or tampered with). E-mail if you want to trade: bbwolf@mailcity.com

Actually you point in case of an global emergency is quite lame.....take the global comunications structure you now have away from you and you would BEG a ham to make an autopath for you. For the ignorant and stupid of you out there believe or not right now there arm MANY vollunteer hams that are right now autopatching back to the US during our war times. Yes hams actually sit all day long and make necessary phone calls for our government back to the good ol USA. Now for you dumb people out there exsplain to me why they do this??? Simple its the best way to communicate.
"Karl Vesterling" <karl.vesterling@verizon.net> wrote in message
news:%Za38.7731$hp6.4430@nwrddc01.gnilink.net...
Getting rid of the Morse requirement for the HF bands. I second that motion!

Here's why. Years ago people used to beat very loud drums to communicate over very long distances. Some even used smoke signals. I cannot I imagine a situation where I would have to use either one of those methods to communicate. Nor can I see any use for Morse Code with today's available technology.

Having Morse Code as a requirement for HF privleges is analogous to requiring the knowledge of how to saddle a horse in order to get your drivers license. As far as you CDL endorsed guys out there, you'd have to learn how to hitch a wagon.

I mean, what's next? Having to make a telephone out of two tin cans and a string in order to get a computer networking degree from Duh-Vry?

It serves no purpose at all. Why bother knowing how to transmit 13 wpm when you can send data at WAAY faster speeds halfway across the planet in under 300ms?????

No - wait. Let me think about this. Here are the only possible scenarios I can imagine that justify Morse Code as a requirement for HF use.

1.. If the commies attacked and most of our transistors were blown from the EMP then the old tube rig would be the only thing that would function as I'm hiding under my 1950's desk / emergency bomb shelter.

2.. What if the earth crashes into the sun? The solar flares would knock out all of our communications satellites for sure then! Tubes would be the only option!

3.. Suppose those Aliens that call into Art Bell from the future decide to attack earth with their super magneto ditigilator distructor beam weapon?

I'm running short here on Ideas for "HYPOTETICAL" situations where I would actually need to know Morse Code, smoke signals, or pound on some very loud drums in today's world. Feel free to contribute to the list!

Dunno... Nostalgia? That seems to be the only purpose for it.

What happens when all this digital fails? You unknowing people do not understand what you are saying. I hate code but understand under the adverse conditions CW will get through as to where voice is only starting to. What do you hear on a dying DX communication the roger beep right? Why do they bleed over other bands??? Because they are a stronger form of bandwith usage. Do some reasearch before you shout and rant all the time it will save you from looking dumb

No, digital has to be in yes/no and it helps if the coding is parallel
rather than serial and does not require the sense God gave a billygoat to
decode if you have the money and bandwidth. Yes, there are significant
diffs between OOK Morse and digital modes. The original digital mode was
Murray/Baudot TTY which Teletype Corp made work with all sorts of gears,
motors, sliding bars and a delightful odor of burning machine oil. It did
a serial-to-parallel port conversion and clanked away merrily. Add two
parity bits to it and Shazaam, SITOR in use today on the seas.

Originally the connections were DC, the infamous 60 ma loop from which 'out of the loop' came in Beltwayese. The last stock tickers on DC were eliminated by NY Bell not that many years ago. Then we went to audio coupling, the infamous 'modem' AFSK if you like. Mark was 2125 Hz and space kind of wandered from 2295, thru 2550, to 2875. Then some bright soul figured that both sides of a line could transmit and receive at the same time or two teleprinters could be used in either mode at either end. Now you have four freqs and first you had better get them right to prevent falsing and second you have to use an old Morse technique for keying them that shaped the pulses to prevent clicks -- Morse lesson #1: there ain't no such thing as square wave. Eight circuit TTY was done on phone lines when phone lines were pretty groady.
The problems we are seeing today with digital transmission are nothing new.

DSP, Digital Signal Processing, is an interesting frontier but at the moment that is all it is. Hardly licensing material. So just what areas in the 'digital' realm are available that are not already in the Extra question pool?? Strikes me that digital bandwidth is the best area for testing :-)

Dick NBK

The code has been essentially killed. 5 wpm can be managed, even if you
are dyslexic.

The code may go away completely, in the future. But there are some
international agreements that will have to be modified first.

By your argument, we should get rid of hobby radios - period. They are all
much slower than e-mail, and not nearly as easy or reliable.

> Dunno... Nostalgia? That seems to be the only purpose for it.

Again, the same could be said for Ham radio and CB radio.

I wouldn't say it is outdated. It is more reliable than anything except some of the exotic digital modes that are in the experimental stages right now. I can copy code when the signal is too week to use even SSB.

I doubt if digital AM takes 50 MHz. The company I used to work for was considering changing their trunked repeaters from analog to digital. In the frequency space required for three analog repeaters, they could put 5 digital. The analog stations required 12.5 kHz - so lets be generaous and say that the three took 50 kHz. That means that the digital FM signals would only require 10 kHz. And this includes guard bands etc to make sure adjacent channels do not interfere with each other.

As promised, I want to let the group know that today I received the rig that I purchased from John in late December. While I have no doubts that the fact that I posted my original request for information from other folks about him was the deciding factor in the sale actually being completed, he did in fact follow through on his end of the sale, so for that I say thanks. There are differences in our criteria for rating condition, but I did get a working rig. Marty, let us know how you make out.

It seems to have worked, more or less, in the cellphone biz and in trunked systems. The 50kHz bandwidth (I left it undimensioned because it seemed obvious) of the proposed AM standard requires the use of the two guard channels on either side. Voice of America's Kim Eliot dealt with it a few months ago. The SW digital transmissions originally designed for a 10kHz bandwidth takes over 20 and has led to application for some new SW broadcast freqs. American TV is hopeless. Then there is the problem of multi-path shutting things down and turning screens blue; an old NEC analog trick (not ever imported here because it also decoded dirty movies in motel rooms) is being built into the system or no one's indoor antenna will work.

A related issue is the frequency hopping of some digital cell systems, primarily Nextel but there are others, that can and does take it out of band under heavy loads. Not knocking it but let's be realistic here. An awful lot of 'advanced' digital stuff does not do what it says it does and/or does not do it within regs. In large part, it is the inability to prevent internal IMD products from roaring out of the box. Ever wondered why it took so long for standards to be set on modems?

There ain't no such things as free lunches or square waves.

Professor your statement is incorrect. Unless they meet the
requirements stated in title 47 the amplifiers are illegal!

See title 47 2.803 and 2.815 below.

WAIS Document Retrieval[Code of Federal Regulations]
[Title 47, Volume 1, Parts 0 to 19]
[Revised as of October 1, 1999]
From the U.S. Government Printing Office via GPO Access
[CITE: 47CFR2.815]

[Page 552-553]

TITLE 47--TELECOMMUNICATION

CHAPTER I--FEDERAL COMMUNICATIONS COMMISSION

PART 2--FREQUENCY ALLOCATIONS AND RADIO TREATY MATTERS; GENERAL RULES
AND REGULATIONS--Table of Contents

Subpart I--Marketing of Radio-frequency Devices

Sec. 2.815 External radio frequency power amplifiers.

(a) As used in this part, an external radio frequency power
amplifier is any device which, (1) when used in conjunction with a
radio
transmitter as a signal source is capable of amplification of that
signal, and (2) is not an integral part of a radio transmitter as
manufactured.
(b) After April 27, 1978, no person shall manufacture, sell or
lease, offer for sale or lease (including advertising for sale or
lease), or import, ship, or distribute for the purpose of selling or
leasing or offering for sale or lease, any external radio frequency
power amplifier or amplifier kit capable of operation on any frequency
or frequencies between 24 and 35 MHz.

[[Page 553]]

Note: For purposes of this part, the amplifier will be deemed incapable of operation between 24 and 35 MHz if:
(1) The amplifier has no more than 6 decibels of gain between 24 and
26 MHz and between 28 and 35 MHz. (This gain is determined by the ratio
of the input RF driving signal (mean power measurement) to the mean RF output power of the amplifier.); and
(2) The amplifier exhibits no amplification (0 decibels of gain) between 26 and 28 MHz.

(c) No person shall manufacture, sell or lease, offer for sale or lease (including advertising for sale or lease) or import, ship or distribute for the purpose of selling or leasing or offering for sale or
lease, any external radio frequency power amplifier or amplifier kit capable of operation on any frequency or frequencies below 144 MHz unless the amplifier has received a grant of type acceptance in accordance with subpart J of this part and subpart C of part 97 or other
relevant parts of this chapter. No more than 10 external radio frequency
power amplifiers or amplifier kits may be constructed for evaluation purposes in preparation for the submission of an application for a grant
of type acceptance.

Note: For the purposes of this part, an amplifier will be deemed incapable of operation below 144 MHz if the amplifier is not capable of
being easily modified to increase its amplification characteristics below 120 MHz, and either:
(1) The mean output power of the amplifier decreases, as frequency decreases from 144 MHz, to a point where 0 decibels or less gain is exhibited at 120 MHz and below 120 MHz; or
(2) The amplifier is not capable of even short periods of operation
below 120 MHz without sustaining permanent damage to its amplification circuitry.

(d) The proscription in paragraph (b) of this section shall not apply to the marketing, as defined in paragraph (b) of this section, by
a licensed amateur radio operator to another licensed amateur radio operator of an external radio frequency power amplifier fabricated in not more than one unit of the same model in a calendar year by that operator provided the amplifier is for the amateur operator's personal use at his licensed amateur radio station and the requirements of Secs. 97.315 and 97.317 of this chapter are met.
(e) The proscription in paragraph (c) of this section shall not apply in the marketing, as defined in paragraph (c) of this section, by

a licensed amateur radio operator to another licensed amateur radio operator of an external radio frequency power amplifier if the amplifier
is for the amateur operator's personal use at his licensed amateur radio
station and the requirements of Secs. 97.315 and 97.317 of this chapter
are met.

[40 FR 1246, Jan. 7, 1975; 40 FR 6474, Feb. 12, 1975, as amended at 43 FR 12687, Mar. 27, 1978; 43 FR 33725, Aug. 1, 1978; 46 FR 18981, Mar. 27, 1981; 62 FR 10470, Mar. 7, 1997]

TITLE 47--TELECOMMUNICATION

CHAPTER I--FEDERAL COMMUNICATIONS COMMISSION

PART 2--FREQUENCY ALLOCATIONS AND RADIO TREATY MATTERS; GENERAL RULES AND REGULATIONS--Table of Contents

Subpart I--Marketing of Radio-frequency Devices

Sec. 2.803 Marketing of radio frequency devices prior to equipment authorization.

(a) Except as provided elsewhere in this section, no person shall sell or lease, or offer for sale or lease (including advertising for sale or lease), or import, ship, or distribute for the purpose of selling or leasing or offering for sale or lease, any radio frequency device unless:
(1) In the case of a device subject to certification, such device has been authorized by the Commission in accordance with the rules in this chapter and is properly identified and labelled as required by Sec. 2.925 and other relevant sections in this chapter; or
(2) In the case of a device that is not required to have a grant of
equipment authorization issued by the Commission, but which must comply
with the specified technical standards prior to use, such device also complies with all applicable administrative (including verification of the equipment or authorization under a Declaration of Conformity, where
required), technical, labelling and identification requirements specified in this chapter.

(b) The provisions of paragraph (a) of this section do not prohibit conditional sales contracts between manufacturers and wholesalers or retailers where delivery is contingent upon compliance with the applicable equipment authorization and technical requirements, nor do they prohibit agreements between such parties to produce new products, manufactured in accordance with designated specifications.
(c) Notwithstanding the provisions of paragraphs (a), (b), (d) and (f) of this section, a radio frequency device may be advertised or displayed, e.g., at a trade show or exhibition, prior to equipment authorization or, for devices not subject to the equipment authorization requirements, prior to a determination of compliance with the applicable technical requirements provided that the advertising contains, and the display is accompanied by, a conspicuous notice worded as follows:

This device has not been authorized as required by the rules of the Federal Communications Commission. This device is not, and may not be, offered for sale or lease, or sold or leased, until authorization is obtained.

(1) If the product being displayed is a prototype of a product that has been properly authorized and the prototype, itself, is not authorized due to differences between the prototype and the authorized product, the following disclaimer notice may be used in lieu of the notice stated in paragraph (c) introductory text of this section:

Prototype. Not for sale.

(2) Except as provided elsewhere in this chapter, devices displayed under the provisions of paragraphs (c) introductory text, and (c)(1) of this section may not be activated or operated.
(d) Notwithstanding the provisions of paragraph (a) of this section, the offer for sale solely to business, commercial, industrial, scientific or medical users (but not an offer for sale to other parties or to end users located in a residential environment) of a radio frequency device that is in the conceptual, developmental, design or pre-production stage is permitted prior to equipment authorization or, for devices not subject to the equipment authorization requirements, prior to a determination of compliance with the applicable technical requirements provided that the prospective buyer is advised in writing at the time of the offer for sale that the equipment is subject to the FCC rules and that the equipment will

[[Page 551]]

comply with the appropriate rules before delivery to the buyer or to centers of distribution. If a product is marketed in compliance with the
provisions of this paragraph, the product does not need to be labelled with the statement in paragraph (c) of this section.
(e)(1) Notwithstanding the provisions of paragraph (a) of this section, prior to equipment authorization or determination of compliance
with the applicable technical requirements any radio frequency device may be operated, but not marketed, for the following purposes and under
the following conditions:
(i) Compliance testing;
(ii) Demonstrations at a trade show provided the notice contained in
paragraph (c) of this section is displayed in a conspicuous location on,
or immediately adjacent to, the device;
(iii) Demonstrations at an exhibition conducted at a business, commercial, industrial, scientific, or medical location, but excluding locations in a residential environment, provided the notice contained in
paragraphs (c) or (d) of this section, as appropriate, is displayed in a
conspicuous location on, or immediately adjacent to, the device;
(iv) Evaluation of product performance and determination of customer
acceptability, provided such operation takes place at the manufacturer's
facilities during developmental, design, or pre-production states; or
(v) Evaluation of product performance and determination of customer
acceptability where customer acceptability of a radio frequency device cannot be determined at the manufacturer's facilities because of size or
unique capability of the device, provided the device is operated at a business, commercial, industrial, scientific, or medical user's site, but not at a residential site, during the development, design or pre-production stages. A product operated under this provision shall be labelled, in a conspicuous location, with the notice in paragraph (c) of
this section.
(2) For the purpose of paragraphs (e)(1)(iv) and (e)(1)(v) of this section, the term manufacturer's facilities includes the facilities of the party responsible for compliance with the regulations and the manufacturer's premises, as well as the facilities of other entities working under the authorization of the responsible party in connection with the development and manufacture, but not marketing, of the equipment.
(e)(3) The provisions of paragraphs (e)(1)(i), (e)(1)(ii), (e)(1)(iii), (e)(1)(iv), and (e)(1)(v) of this section do not

eliminate
any requirements for station licenses for products that normally
require
a license to operate, as specified elsewhere in this chapter.
(i) Manufacturers should note that station licenses are not
required
for some products, e.g., products operating under part 15 of this
chapter and certain products operating under part 95 of this chapter.
(ii) Instead of obtaining a special temporary authorization or an
experimental license, a manufacturer may operate its product for
demonstration or evaluation purposes under the authority of a local
FCC
licensed service provider. However, the licensee must grant permission
to the manufacturer to operate in this manner. Further, the licensee
continues to remain responsible for complying with all of the
operating
conditions and requirements associated with its license.
(4) Marketing, as used in this section, includes sale or lease, or
offering for sale or lease, including advertising for sale or lease,
or
importation, shipment, or distribution for the purpose of selling or
leasing or offering for sale or lease.
(5) Products operating under the provisions of this paragraph (e)
shall not be recognized to have any vested or recognizable right to
continued use of any frequency. Operation is subject to the conditions
that no harmful interference is caused and that any interference
received must be accepted. Operation shall be required to cease upon
notification by a Commission representative that the device is causing
harmful interference and shall not resume until the condition causing
the harmful interference is corrected.
(f) For radio frequency devices subject to verification and sold
solely to business, commercial, industrial, scientific, and medical
users (excluding

[[Page 552]]

products sold to other parties or for operation in a residential
environment), parties responsible for verification of the devices
shall
have the option of ensuring compliance with the applicable technical
specifications of this chapter at each end user's location after
installation, provided that the purchase or lease agreement includes a
proviso that such a determination of compliance be made and is the
responsibility of the party responsible for verification of the
equipment. If the purchase or lease agreement contains this proviso
and
the responsible party has the product measured to ensure compliance at
the end user's location, the product does not need to be labelled with
the statement in paragraph (c) of this section.
(g) The provisions in paragraphs (b) through (f) of this section
apply only to devices that are designed to comply with, and to the

best
of the responsible party's knowledge will, upon testing, comply with
all
applicable requirements in this chapter. The provisions in paragraphs
(b) through (f) of this section do not apply to radio frequency
devices
that could not be authorized or legally operated under the current
rules. Such devices shall not be operated, advertised, displayed,
offered for sale or lease, sold or leased, or otherwise marketed
absent
a license issued under part 5 of this chapter or a special temporary
authorization issued by the Commission.
(h) The provisions in subpart K of this part continue to apply to
imported radio frequency devices.

Roger that and for reasons I cannot fathom. In later stages of Morse denial gonads get in the way but that does not explain the initial reluctance.

It is a mechanical activity like Nintendo at which my 8 year-old nephew regularly cleans my clock. One learns it by doing it, pure and simple. Of course you are going to fumble and stumble; if guys were honest they would look back at their earlier sexual adventures and wince and laugh at the same time and Morse is no different. When it became clear that perfection was not expected, my 13 year-old football players put on a pretty good show as long as Daddy did not show up at practice.

Morse is simple-minded: it does not respect your age, intelligence, bankbook, social standing, masculinity, or bitchen coolth. It respects time and attention to detail, nothing else. Good thoughts mean nothing, saints and sinners are equal in the sight of Morse. So expect to klutz it up.

The hard part is not lying to oneself; that is what leads to Lifer Tech Syndrome.

We don't use any pin diodes in our designs at work. They are not necessary for the application we are involved in. I have never used them before but they sound interesting.

Stuart Crane is /was the fameous Bircher from De-troit that had his chapter growing because he was researching deeper into conspiracys and the people behind them, and people that the "society" didn't want you to know about. He put out many tapes & videos that were EXTREMELY interesting. I met him once and made an audio tape with him, with a few of my friends. What is a Wayne Green? I remember the Broham "Mr. Joe Green" of CB Channel 6 or 10 fame in da past!!!!!!!!!! He was MEAN JOE GREEN, as I remember!!!!!!!! Dave!!!!!!!!!!!!!!!!!!

Yep, DO NOT buy coax from a RAT ! Rat Shack. I can sell you 25' I make up
from a 1000' roll 95% shielded 8259 Belden RG-58 (you don't need 8x @ 25').
E mail me for de-tails! @ truth@planetc.com
Dave

And now, the computer scientist became a spellchecker master and he
will teach how do we spell (BiOhAzArD613)...

B - BISEXUAL
I - IMPOTENT
O - OR
H - HORRIBLE
A - ASS
Z - ZOONING
A - ALL
R - RIGHT
D - DURING
6 - SIX YEARS
1 - ONE MONTH
3 - TREE WEEKS

Is it all right now?

WHO THE HELL SAID THAT " ELETRONICS " INTENDED TO BE " ELECTRONICS " ?

WHO ??????

I wrote it this way and that is the way i want it to be! I DON'T CARE
WHAT THE HELL (BiOhAzArD613) is for you,

but i would respect you if you have repected me.

Want to know what it seems to me ?

Ah?

FUCK YOU!!!

And, your mother is here. She said to me that her ass will be ready to
the world when you answer this.
Now, i have to go. As (BiOhAzArD613) said, i am too lazy. What he
don't know is that i am lazy fucking his mother ass...

NOTE: I would like to thank everyone who have seriously mailed me or
helped with their information or even have read this trhead and
respect every idea as big mans.

Yep, I think they did. WALLY Mart IS probably to blame, as will as the Govt., and the Federal Reserve Banks, which have created this Govt. controlled "depression" we are currently in, for the purpose of putting THOUSANDS out of business, just so we can have a more "communist friendly" country. Because in a commie country, there is only ONE discount store. It is called Hammer & sickle Wally's World!!!!!!!!!!!!!!!! (that IS the Target)!!! (Wally's commercials have been EXTREMELY arrogant lately, like "If Wall-Mart doesn't have it, you probably don't need it!"). What will The Lord use to bring Wally down? My local tire store calls Wally THE TOWN KILLER ! Dey is American killers, like da Taliban!!!!!!!!!!!!! Dave!!!!!!!!!!!!!!!!!!!!

There was a WWII US soldier who was granted much needed R & R after 6 weeks of heavy fighting in Europe. On the train to London, he found that all the seats were occupied--except
one. There was a "veddy" proper English lady seated by the open window, and her little dog
was in the other seat The soldier removed his hat and said, "Pardon me, Ma'am, but
may I have that seat?"

The proper English lady looked at the weary soldier with great disdain and sniffed, "You Amer-
icans are so uncouth. Cawn't you see that my little Fifi is in that seat?"

The disappointed soldier once again walked the length of the train in search of a seat in which to
rest his tired bones, but found himself once again facing the English lady--there simply weren't
any seats to be had. So, once again, he pled with the oh-so proper lady, "Ma'am, could I
PLEEEZE use that seat if only for a little while?"

" I say, you Americans are the most low, uncouth class of people I have ever encountered," her
voice dripping with high disdain for this poor fellow.

The soldier, without replying, reached down, picked up the little dog, and flung it out the window, and sat down.The lady shrieked and screamed for someone to come to her aid
and properly thrash this horrible American.

An equally proper English gentleman across the aisle, clad in stiff, high collar and bowler hat,
remarked,

"Ahem, I say, you yanks DO have a penchant for doing the wrong thing. You use your forks
with the wrong hand, you drive your autos on the wrong side of the road, and (sniff).....
you just threw the wrong BITCH out the window!!!!"

Your right I won't make march with @home because that is when the deal they have with Comcast runs out Feb 28... Cry all you want Steve you big asshole I can have any amount of nic's that i like, if it bothers you don't read my posts, better yet don't reply to them, for the life of me why do you feel the need to reply to me or to my posting IGNORE ME or Is there something else drawing you in ? If I am standing on a street talking you can either listen to me, walk by me, stop and talk to me, or walk by me and then cry because you don't like what I have to say it is your choice to make. I can just as easily play your game Steve you won't like how I play I will cause you more grief than you will cause me along with your friend Mark Beck. Go cry on someone elses shoulder your starting to look real silly.

April 7, 2000 Forfeiture Order Against "Two Way Shop" in the amount of ($7000) for Offering Linear Amplifiers for Sale

FCC INVESTIGATION LEADS TO ARREST
OF UNLICENSED AMATEUR RADIO OPERATOR

The Federal Communications Commission today announced that an investigation by its Enforcement Bureau led to the July 20, 2000, arrest of Mr. William Flippo, Jupiter, Florida, for operating an unlicensed radio station on amateur radio frequencies and for intentionally causing interference to licensed amateur radio stations.

The Enforcement Bureau, responding to numerous complaints, had previously warned Mr. Flippo to stop his illegal activities and had issued him a $20,000 forfeiture. Despite the Enforcement Bureau's administrative response, Mr. Flippo did not stop his illegal activity.

The United States Attorney's Office for the Southern District of Florida charged Mr. Flippo with four counts of unlicensed radio operation (47 U.S.C. ï¿½ 301) and four counts of interfering with licensed radio stations (47 U.S.C. ï¿½ 333), which he allegedly committed between June 8, 1999, and April 11, 2000. The United States Marshals Service arrested Mr. Flippo at his Jupiter, Florida home, from which it also seized his radio transmitting equipment.

If convicted, Mr. Flippo could face up to one year in prison and a fine of up to $10,000 for each violation.

Commenting on behalf of the Enforcement Bureau, Jane E. Mago, Deputy Chief, commended the members of the amateur radio community, who provided information leading to Mr. Flippo's arrest, and thanked the United States Attorney's Office

for the Southern District of Florida and the United States Marshals Service for their efforts in prosecuting the case.

TOP
FCC INVESTIGATION LEADS TO FINE
FOR LICENSED AMATEUR RADIO OPERATOR

I. INTRODUCTION
1. In this Memorandum Opinion and Order (``Order''), we deny Leonard Martin's petition for reconsideration and affirm the Forfeiture Order1 issued against Leonard D. Martin in the amount of four thousand dollars ($4,000) for willfully and repeatedly violating Sections 301 and 303(n) of the Communications Act of 1934, as amended (``the Act''). 2 The noted violations involve Mr. Martin's operation of a two-way radio station without Commission authorization and his refusal to allow inspections of his radio installation.

2. On March 3, 2000, the Houston Resident Agent Office (``Houston Office'') issued a Notice of Apparent Liability for Forfeiture (``NAL'') in the amount of seventeen thousand dollars ($17,000) to Mr. Martin for the referenced violations.3 Mr. Martin filed a response to the NAL. On July 12, 2000, the Enforcement Bureau (``Bureau'') released a Forfeiture Order reducing the proposed forfeiture to $4,000.

II. BACKGROUND
3. Mr. Martin is the former licensee of amateur station KC5WHN. By letter of November 3, 1998, the Commission notified Mr. Martin of complaints concerning a station identifying as KC5WHN. The complaints asserted that the station identifying as KC5WHN was operating on frequencies which were not authorized for that station. In his telephone response to that letter, Mr. Martin denied the alleged unauthorized operation.

4. On February 27, 1999, an agent from the Houston Office (``the agent''), using a mobile automatic direction finding (``MADF'') vehicle, observed voice radio transmissions on frequencies 27.535 and 27.545 MHz. Frequency 27.535 MHz is allocated exclusively to Industrial radio stations. Frequency 27.545 MHz is allocated exclusively to United States Government radio stations. The transmissions were unidentified, but the operator responded to the name ``Leonard.'' Using the MADF vehicle, the agent determined that the source of the transmissions was an antenna mounted on the residence at 4415 Spellman, Houston, Texas, which was then the address of record for Mr. Martin's amateur service station. There was no record of a Commission authorization permitting Mr. Martin to operate on 27.535 MHz or 27.545 MHz.

5. On March 15, 1999, the agent, using an MADF vehicle, observed voice radio transmissions on 27.370 MHz, a frequency allocated as a ``guard'' frequency between authorized channels in the Citizens Band Radio Service. The operator identified himself as ``Leonard.'' Using the MADF vehicle, the agent determined that the source of the transmissions was a vertical antenna mounted on the residence at 4415 Spellman, Houston, Texas. Immediately after his monitoring observations, the agent knocked on the door of the residence. Mr. Martin answered the door and refused the agent's request to inspect the radio station located in the residence. The agent informed Mr. Martin that his previously

observed operation on 27.535 and 27.545 MHz was unlicensed and in violation of Section 301 of the Act because Mr. Martin held no Commission authorization to operate on those frequencies. The agent also informed Mr. Martin that his refusal to allow an inspection constituted violation of Section 303(n) of the Act.

6. On April 2, 1999, the Houston Office issued Mr. Martin an Official Notice of Violation (``NOV'') for violations of Sections 301 and 303(n) of the Act. In Mr. Martin's April 7, 1999, response to the NOV, he stated: ``I now fully understand that operation on the frequencies outlined is a violation ... that the FCC has the authority to inspect all radio installations... [and] ... I promise no further action by the Commission will be necessary to insure my complete compliance with the FCC Rules....''

7. On July 22, 1999, Mr. Martin submitted his amateur service license for KC5WHN to the Commission for cancellation. By letter of July 23, 1999, the Commission acknowledged receipt of the license, and confirmed that it was cancelled effective July 23, 1999. The letter also warned Mr. Martin that any unlicensed radio operation would constitute violation of Section 301 of the Act.

8. On October 19, 1999, the agent investigated an interference complaint against Mr. Martin. The agent, using an MADF vehicle, observed voice radio transmissions on frequency 27.535 MHz, and determined that the source of those transmissions was a vertical antenna mounted on Mr. Martin's residence, at 4415 Spellman, Houston, Texas. This frequency is allocated exclusively to licensed Industrial radio stations. There was no record of a Commission authorization permitting Mr. Martin to operate on 27.535 MHz.

9. On October 26, 1999, the agent, using an MADF vehicle, observed voice radio transmissions on 27.455 MHz, a frequency allocated exclusively to Industrial radio stations. Using the MADF vehicle, the agent determined that the source of those transmissions was a vertical antenna mounted on Mr. Martin's residence, at 4415 Spellman, Houston, Texas. There was no record of a Commission authorization permitting Mr. Martin to operate on 27.455 MHz. Immediately after the monitoring, the agent knocked on the door of the residence and requested permission to inspect the station located there. Mr. Martin, who answered the door, refused to allow an inspection.

10. On March 3, 2000, the Houston Office issued a NAL in the amount of $17,000 to Mr. Martin for violations of Sections 301 and 303(n) of the Act. In his response to the NAL, Mr. Martin requested cancellation of the proposed forfeiture but did not deny violating Sections 301 and 303(n).

11. In its Forfeiture Order, released July 12, 2000, the Bureau concluded that Mr. Martin willfully and repeatedly violated Section 301 of the Act by operating radio transmitting apparatus without authorization on February 27, October 19, and October 26, 1999; and that he willfully and repeatedly violated Section 303(n) of the Act by refusing to make his radio installation available for inspection on March 15 and October 26, 1999. The Forfeiture Order assessed a monetary forfeiture of $4,000 for those violations. The sole basis for reducing the $17,000 forfeiture amount proposed by the NAL to $4,000 was Mr.

Martin's inability to pay more than $4,000.

12. In his petition for reconsideration of the Forfeiture Order, Mr. Martin still does not deny operating radio transmitting apparatus without authorization or refusing to make his radio installation available for inspection. However, he propounds the following arguments for reduction or rescission of the forfeiture:

(a) The Commission ``failed to comply with its own procedures.'' Specifically, Mr. Martin asserts that, when an FCC agent requested permission to inspect his radio installation, the agent ``did not provide [Mr. Martin] proper notice to inspect [Mr. Martin's] communications devices or of any pending investigation, or allow [Mr. Martin] an opportunity to have an attorney present'' and did not allow sufficient time for Mr. Martin ``to exercise [his] rights as a U.S. Citizen to review any FCC rule or federal law that would permit unwarranted entry into [his] residence by the FCC.''

(b) The Forfeiture Order ``is based upon unsubstantiated allegations with insufficient evidentiary support.'' In particular, Mr. Martin contends that another station near his residence ``could have been'' the source of the transmissions observed by the FCC agent and that there is insufficient proof that Mr. Martin was the operator the station observed by the FCC agent.

(c) The forfeiture amount is ``grossly disproportionate to the alleged violations.'' Specifically, Mr. Martin asserts that the forfeiture amount of $4,000 is unreasonable ``given the nature and extent of the alleged violations.'' Mr. Martin also contends that the Bureau did not consider all the required mitigating factors. According to Mr. Martin, these include: the number of occurrences; the corrective measures Mr. Martin agreed to take; Mr. Martin's ability to pay; and ``the fact that no licensed radio station complained of interference nor was there any proof of actual harm caused by any radio transmission from [Mr. Martin's] residence.''

(d) The Commission, by imposing a forfeiture against Mr. Martin, has exceeded its authority to regulate interstate communications under the Commerce Clause of the Constitution. Mr. Martin argues that, although Section radio communications within one state as well as between states, the statute must be interpreted and applied in a manner consistent with constitutional limitations. In particular Mr. Martin claims that, because there has been no showing that his transmissions were capable of causing harmful interference to interstate communications, he cannot be prohibited from making those transmissions without a license.

(e) The prohibition of transmissions by Mr. Martin on frequencies for which he is not authorized and the imposition of a monetary forfeiture against Mr. Martin for making such transmissions violate the First Amendment to the United States Constitution.

(f) The imposition of a forfeiture against Mr. Martin without an opportunity for a hearing or ``to remedy [Mr. Martin's] alleged violation Section 301 of the Communications Act'' violates the Due Process clause of the Fourteenth Amendment to the United States Constitution.

(g) The Commission is violating the Due Process clause of the Fourteenth Amendment to the United States Constitution by ``selectively'' initiating a forfeiture proceeding against Mr. Martin and ``not targeting thousands of other stations'' which operate without authorization.

III. DISCUSSION
13. We reject the arguments made in Mr. Martin's petition for reconsideration:

(a) The agent who requested permission to inspect Mr. Martin's radio installation on March 15 and October 26, 1999, followed proper procedures. On both occasions the agent informed Mr. Martin that Section 303(n) of the Act authorizes the Commission to inspect radio installations and that the agent had traced transmissions on frequencies for which Mr. Martin was not authorized to Mr. Martin's residence. Immediate, on-the-spot inspections are necessary in such circumstances because ``Any delay . . . can result in changed conditions of the transmitting equipment or its operation, adversely affecting the efficiency of inspections." Ralph Yago, 35 FCC 113, 125 (Rev.Bd. 1963). Further, nothing in the Communications Act requires the Commission to allow a subject of an inspection to have opportunity to have an attorney present during a civil investigation proceeding.

(b) The Bureau's conclusion that Mr. Martin operated radio transmitting apparatus without authorization on February 27, October 19, and October 26, 1999, is supported by substantial evidence. On each occasion, the agent determined electronically that transmissions on a frequency or frequencies for which Mr. Martin was not authorized emanated from an antenna installed at Mr. Martin's residence. The only person observed at Mr. Martin's residence on any of these occasions was Mr. Martin. Mr. Martin has had ample opportunity to provide information, if it exists, which shows that another person operated the station located at his residence; but he has not done so. During the transmissions observed on February 27, 1999, the operator of the station located at Mr. Martin's residence responded to the name ``Leonard.''

(c) As the NAL explicitly states, the forfeiture amount in this case was assessed in accordance with Section 503(b) of the Act,4 Section 1.80 of the Rules,5 and The Commission's Forfeiture Policy Statement and Amendment of Section 1.80 of the Rules to Incorporate the Forfeiture Guidelines, 12 FCC Rcd 17087 (1997), recon. denied, 15 FCC Rcd 303 (1999) (``Policy Statement''). Section 503(b) of the Act requires that, in examining Mr. Martin's response, the Commission take into account the nature, circumstances, extent and gravity of the violation and, with respect to the violator, the degree of culpability, any history of prior offenses, ability to pay, and other such matters as justice may require.6 In the Forfeiture Order, we considered all factors applicable to this matter and reduced the monetary forfeiture from $17,000 to $4,000 on the basis of Mr. Martin's inability to pay a larger amount. Mr. Martin has not furnished any information which justifies a further reduction.

(d) Mr. Martin's Commerce Clause argument is dependent on the incorrect assumption that transmissions emanating from his residence on 27.445, 27.535 and 27.545 MHz are not capable of interfering with interstate communications. In fact, transmissions on those frequencies are capable of long range (interstate) propagation through the natural phenomenon known as sky (``skip'') wave. Furthermore, the view that the Commission cannot constitutionally

regulate communications unless they are capable of interfering with interstate communications is erroneous. See National Broadcasting Co. v. United States, 319 U.S. 190, 209-217 (1943); FCC v. League of Women Voters of California, 468 U.S. 364, 377 (1984); and Stephen Paul Dunifer, 11 FCC Rcd 718, 727 (1995).

(e) The prohibition against unlicensed operation does not abridge Mr. Martin's First Amendment rights. The United States Supreme Court has held repeatedly that there is no constitutional right to use radio facilities without a license. See Red Lion Broadcasting Co. v. FCC, 395 U.S. 367, 388 (1969); and National Broadcasting Co. v. United States, 319 U.S. 190, 227 (1943).

(f) . The Commission did not abridge Mr. Martin's right to procedural Due Process by failing to provide opportunities for an evidentiary hearing and for correction of the violations prior to the imposition of the forfeiture. Sections 503 and 504 of the Communications Act7 provide safeguards which satisfy Due Process requirements.8 See Stephen Paul Dunifer, 11 FCC Rcd 718, 729 (1995). Further, nothing in the Communications Act requires the Commission to provide an unlicensed operator the opportunity for an evidentiary hearing or an opportunity to correct a violation prior to imposition of a forfeiture.

(g) The Commission did not abridge Mr. Martin's right to procedural Due Process by proceeding against him ``selectively.'' The case against Mr. Martin arose from the routine investigation of a complaint. As the Commission stated in KMAP, Inc., 46 FCC 2d 978 (1974): ``While our limited resources may result in some violators going unpunished, that does not mean that we cannot impose sanctions against those violators we do find.''9

14. We have examined Mr. Martin's petition for reconsideration pursuant to the statutory factors set forth above, and in conjunction with the Policy Statement as well. As a result of our reconsideration, we conclude that Mr. Martin has failed to provide a sufficient justification for rescission or further reduction of the forfeiture.

IV. ORDERING CLAUSES

15. ACCORDINGLY, IT IS ORDERED that, pursuant to Section 1.106 of the Rules, Mr. Martin's petition for reconsideration IS DENIED and the Forfeiture Order, 15 FCC Rcd 12699 (Enf. Bur. 2000), released on July 12, 2000, IS AFFIRMED.

16. Payment of the forfeiture of $4,000 shall be made in the manner provided for in Section 1.80 of the Rules within 30 days of the release of this Order. If the forfeiture is not paid within the period specified, the case may be referred to the Department of Justice for collection pursuant to Section 504(a) of the Act.10 Payment may be made by mailing a check or similar instrument, payable to the order of the ``Federal Communications Commission,'' to the Federal Communications Commission, P.O. Box 73482, Chicago, Illinois 60673-7482. The payment should note ``NAL/Acct. No. X3254-003'' referenced above. Requests for full payment under an installment plan should be sent to: Chief, Credit and Debt Management Center, 445 12th Street, S.W., Washington, D.C. 20554.11

17. IT IS FURTHER ORDERED that a copy of this Order shall be sent by Certified Mail -- Return Receipt Requested, to Mr. Leonard D. Martin at 4415 Spellman,

Houston, Texas 77035.

FCC Issues ($7,000) Forfeiture Order against
Stephen Fowler d/b/a Exports R Us

FORFEITURE ORDER

Adopted: December 28, 2000 Released: December 29, 2000

By the Chief, Enforcement Bureau:

1. In this Forfeiture Order (``Order''), we issue a monetary forfeiture in the amount of seven thousand dollars ($7,000) against Stephen Fowler d/b/a Exports R Us, for willfully violating Sections 2.803 and 2.815 of the Commission's Rules (``Rules'')1 by marketing an unauthorized external frequency power amplifier.

2. On September 28, 2000, the Commission's New Orleans, Louisiana Field Office issued a Notice of Apparent Liability for Forfeiture in the amount of seven thousand dollars ($7,000) to Stephen Fowler d/b/a Exports R Us. Stephen Fowler d/b/a Exports R Us has not filed a response. Based on the information before us, we affirm the forfeiture.

3. Accordingly, IT IS ORDERED THAT, pursuant to Section 503(b) of the Act,2 and Sections 0.111, 0.311 and 1.80 of the Rules,3 Stephen Fowler d/b/a Exports R Us, IS LIABLE FOR A MONETARY FORFEITURE in the amount $7,000, for willful violations of Sections 2.803 and 2.815 of the Rules.

4. Payment of the forfeiture shall be made in the manner provided for in Section 1.80 of the Rules within 30 days of the release of this Order. If the forfeiture is not paid within the period specified, the case may be referred to the Department of Justice for collection pursuant to section 504(a) of the Act.4 Payment may be made by mailing a check or similar instrument, payable to the order of the Federal Communications Commission, to the Federal Communications Commission, P.O. Box 73482, Chicago, Illinois 60673-7482. The payment should note the NAL/Acct. number X3262010. Requests for full payment under an installment plan should be sent to: Chief, Credit and Debt Management Center, 445 12th Street, S.W., Washington, D.C. 20554.

5. IT IS FURTHER ORDERED that a copy of this Forfeiture Order shall be sent by Certified Mail, Return Receipt Requested, to Stephen Fowler d/b/a Exports R Us at 5529 Monroe Hwy, Pineville, Louisiana 71360.

TOP
Amateur radio operator Robert L. Meyers N5WLY
loses license and pays ($1000) fine

ORDER

Adopted: October 5, 2000 Released: October 10, 2000

By the Chief, Enforcement Bureau:

1. In this Order, we adopt a Consent Decree terminating a forfeiture proceeding against Robert L. Meyers (``Meyers'') concerning operation of an Amateur Radio transmitter in violation of Section 333 of the Communications Act of 1934, as amended (the ``Act''), and Sections 97.101(d) and 97.119(a) of the Commission's Rules (the ``Rules'').1 Meyers agrees to submit his Amateur Radio license for cancellation and not re-apply for an Amateur license for a period of 5 years. Meyers further agrees to make a voluntary contribution to the U.S. Treasury of $1,000.

2. The Enforcement Bureau assessed an $8,000 forfeiture against Meyers for violation of Section 333 of the Act and Sections 97.101(d) and 97.119(a) of the Rules.2

3. The Enforcement Bureau staff and Meyers have negotiated the terms of a Consent Decree that would terminate this proceeding. A copy of the Consent Decree is attached hereto and incorporated by reference.

4. We have reviewed the terms of the Consent Decree and evaluated the facts before us. We believe that the public interest would be served by approving the Consent Decree and terminating this proceeding.

5. Accordingly, IT IS ORDERED, pursuant to Sections 4(i) and 4(j) of the Communications Act of 1934, as amended, 47 U.S.C ï¿½ï¿½ 154(i) and 154(j), and the authority delegated in Sections 0.111 and 0.311 of the Commission's Rules, 47 C.F.R. ï¿½ï¿½ 0.111 and 0.311, that the attached Consent Decree is hereby ADOPTED.

6. IT IS FURTHER ORDERED that the voluntary contribution referenced in the Consent Decree shall be paid by a check or money order drawn to the order of the ``Federal Communications Commission.'' Reference should be made on the check or money order to ``NAL Acct. No. X3254- 001.'' The remittance should be sent to: Forfeiture Collection Section, Finance Branch, Federal Communications Commission, P.O. Box 73482, Chicago, Illinois 60673-7482.

7. IT IS FURTHER ORDERED that the above captioned forfeiture proceeding IS TERMINATED.

TOP
Notice of Apparent Liability in the amount of ($8000)
issued against amateur radio operator Paul E. Holcombe K4TOF

FORFEITURE ORDER

Adopted: May 2, 2000 Released: May 3, 2000

By the Chief, Enforcement Bureau:

I. INTRODUCTION
1. In this Forfeiture Order (``Order''), we issue a monetary forfeiture in the amount of eight thousand dollars ($8,000) against Paul E. Holcombe, licensee of amateur radio station K4TOF, Houston, Texas, for willful violation of Section 333 Communications Act of 1934, as amended (``the Act''),1 and Sections 97.101(d) and 97.119 of the Commission's Rules.2 The noted violations involve the operation of an amateur radio station so as to willfully or maliciously cause interference to radio communications and the transmission of unidentified amateur radio communications.

2. On January 13, 2000, the Commission's Resident Agent Office in Houston, Texas, issued a Notice of Apparent thousand dollars ($8,000) to Mr. Holcombe.3 Mr. Holcombe filed a response on February 4, 2000.

II. BACKGROUND

3. Between 1993 and 1999, the Commission's Houston Resident Agent Office received numerous complaints alleging intentional interference to users on the Memorial Emergency Repeater Association's 145.470/144.870 MHz amateur radio repeater in Houston (``MERA repeater''). The interference was allegedly caused by stations transmitting unidentified tones, inflammatory or derogatory remarks, and unmodulated signals, none of which were identified with an FCC-assigned call sign.

4. On May 25, 1999, an FCC agent from the Houston Office, using a mobile automatic direction finding (``MADF'') vehicle to monitor the MERA repeater, observed a radio signal consisting of unidentified tones and remarks being transmitted on the input frequency of the MERA repeater. The agent simultaneously monitored the output frequency of the MERA repeater and observed that this signal would transmit immediately after other stations began transmitting, resulting in interference to communications already in progress on the MERA repeater. At about 8:08 p.m., using the MADF equipment and direction-finding techniques, the agent determined that the source of the unidentified interfering transmissions was a silver Toyota bearing Texas license plate DVZ74F. This vehicle was registered to Paul E. Holcombe, licensee of amateur radio station K4TOF. Immediately thereafter, the Commission agent conducted an interview with Mr. Holcombe and inspected the vehicle. Inside the vehicle, the agent found an amateur radio transceiver which was tuned to the MERA repeater frequency pair and was capable of transmitting on the MERA repeater frequency pair. Although Mr. Holcombe admitted that he owned the vehicle and the amateur radio transceiver and that he was the licensee of amateur radio station K4TOF, he denied intentionally making any radio transmissions that day.

5. On June 2, 1999, the Houston Office issued to Mr. Holcombe an Official Notice of Violation (``NOV'') for willful and malicious interference to radio communications in violation of Section 333 of the Act and Section 97.101(c)4 of the Rules and for transmitting unidentified amateur radio communications in violation of Section 97.119 of the Rules. In his June 4, 1999, response to the NOV, Mr. Holcombe stated that his amateur radio station may have been inadvertently activated on May 25, 1999, but he denied any intent to interfere with other stations. Mr. Holcombe also stated that he suffered from a nerve disorder in his hands which makes it difficult for him to manipulate the controls of the amateur radio transceiver in his vehicle.

6. On January 13, 2000, the Houston Office issued the subject NAL, citing Mr. Holcombe for willful violations of Section 333 of the Act and Sections 97.101(d) and 97.119 of the Rules. In his February 4, 2000, response to the NAL, Mr. Holcombe denies that the violations occurred. Mr. Holcombe asserts that there was a passenger in his car on May 25, 1999, Dennis Rogers, who is willing to testify that the alleged violations did not occur. Mr. Holcombe states that Mr. Rogers told the FCC agent at the time that the alleged violations did not take place, but the agent discounted his statement. In

addition, Mr. Holcombe asserts that the NAL unfairly holds him responsible for violations dating back to 1993. Mr. Holcombe maintains that he is being charged for any and all violations occurring during the period from 1993 to 1999 as a ``convenient target.'' Finally, Mr. Holcombe argues that he has been denied a fair hearing of the facts and the right to due process.

III. DISCUSSION

7. As the NAL explicitly states, the forfeiture amount in this case was assessed in accordance with Section 503 of the Act,5 Section 1.80 of the Rules, 6 and The Commission's Forfeiture Policy Statement and Amendment of Section 1.80 of the Rules to Incorporate the Forfeiture Guidelines, 12 FCC Rcd 17087 (1997), recon. denied, 15 FCC Rcd 303 (1999) (``Policy Statement''). In examining Mr. Holcombe's response, Section 503(b) of the Act requires that the Commission take into account the nature, circumstances, extent and gravity of the violation and, with respect to the violator, the degree of culpability, any history of prior offenses, ability to pay, and other such matters as justice may require. 7

8. Section 333 of the Act and Section 97.101(d) of the Rules both prohibit willful or malicious interference to radio communications. Section 97.119 of the Rules prohibits the transmission of unidentified amateur radio communications. While Mr. Holcombe generally denies that any violations of these provisions occurred, his denial is contradicted by the observations of the FCC agent. On May 25, 1999, using MADF equipment, the investigating FCC agent observed a radio signal consisting of unidentified tones and remarks which would transmit on the MERA repeater input frequency immediately after another station began transmitting, resulting in harmful interference to communications already in progress on the MERA repeater. The agent positively identified the source of the interfering transmissions to be Mr. Holcombe's vehicle. On inspection of Mr. Holcombe's vehicle, the agent found an amateur radio transceiver which was capable of transmitting on the MERA repeater frequency pair and was in fact tuned to the MERA repeater frequency pair. We conclude that this evidence is sufficient to establish that Mr. Holcombe willfully and maliciously interfered with radio communications in willful violation of Section 333 of the Act and Section 97.101(d) of the Rules. As stated in the NAL, the interference was both willful and malicious because Mr. Holcombe timed his transmissions to commence just after other stations had begun transmitting. Mr. Holcombe also willfully violated Section 97.119 of the Rules because h

>> Who's crying,this is how I deal with pond scum like you. Name calling,
> there's a new approach from you.

Your crying Steve, listen to your self , you want to cry to my ISP for what because you don't like what I have to say, so you want to try and silence me. If you would listen to the shit that comes out of your mouths sometime. If I am this big bad NG forger, abuser etc with all the complaints your jack squad has been lodging surely something would have went down by now. You guys revel in the fact you got aarons and dougs accounts cancelled. Thats why you hide behind the skirt that you do you don't want people complaining to your ISP.

> >>I can have any amount of nic's that i like, if it bothers you
> > don't read my posts, better yet don't reply to them,
> >
> You change so many times,I gave up on the killfile. And you win,just like
> a NG terrorist.

Now you want to compare me to a terrorist LOL A few months back you guys cried when Leland mentioned the word terrorist in the same breath as this NG. Your mentioning of the word killfile is all show Steve, If you despise me that much you would ignore me you can't you dont't want to so you reply to me what ever name I use. Just like your fag boyfriend Landsark he feels the need to tell the World he is adding a nic to his Kill file, big deal, and Off topic do you or he think it hurts my feelings when you kill file me. I talk, and you reply to me the name it is under makes no difference. What do you do read a few posts then open up my post and say damn it, no shit not this guy again, he changed nics, he got one over on me I better tell him he is a ass and I had him kill filed. Better yet If I was real smart i would block his email address it has been the same for some time now . But why would I want to do that I really want to talk to this guy George. Is that how it goes Moped? Please tell me so I can understand what you go thru when you read one of my posts .

>
> There's NO excuse for your conduct here,I'm SURE that I'm not just
speaking
> for myself. (if i am,please stop me)

And how is my conduct at least it is not contrary to Federal law like you and your bunch and when did you become the conduct king of rec.radio.cb. I asked a few people about you and they don't like the way you conduct yourself so I guess were even on that end.

> > If you're walking by me and talk to me like that,you'll need a dentist.
So
> my choices are limited here.

Steve why don't you and SD Jones hook up you could be the NG muscle and go around policing things as you illegals see fit Good idea or what? Are you gonna do the same thing to me as you did to Sparky when he looked you up?

> What game am I playing? I Don't flame CBer's!

Me either I point out the Legal aspects of Cb radio, you guys are the ones that get defensive and aggresive to the legal operators who chose to partake in this Ng , makin threats of violence and taking things to the next level, getting accounts pulled, posting phone numbers. All acts of cowardice.....

Man Mopar he's sure crying. He thinks posting
my full name bothers me, LOL! On the contrary though,
he's walking on the street I can go to the other side, if he
follows me then keeps talking to me that's harassment
just like this group. If everyone would let him post, not
respond, then he eventually will go away with the wind,
like dried up dog crap blowing off the lawn.
Yup, ask Jason, Mopar, Jay, Professor,
Tim, Scott, Bert, Richard, jerry, Toll, twist, SD,
Dave or Debby, Bill Eitner, BrainBuster, virtually
everyone else other than his alter egos, he has harassed
everyone of them as the troll he is. Every time he posts it
just shows what a little puss filled troll he really is.

Enough all ready, I think I'll get one of my son's nice juicy
filled diapers freeze dried and have it sent to George's addy,
I'm sure he can find a use for it with all the crap he spews
here.

> April 7, 2000 Forfeiture Order Against "Two Way Shop" in the amount of
($7000)
> for Offering Linear Amplifiers for Sale
>
>
> FCC INVESTIGATION LEADS TO ARREST
> OF UNLICENSED AMATEUR RADIO OPERATOR
>
> The Federal Communications Commission today announced that an
investigation by
> its Enforcement Bureau led to the July 20, 2000, arrest of Mr. William
Flippo,
> Jupiter, Florida, for operating an unlicensed radio station on amateur
radio
> frequencies and for intentionally causing interference to licensed amateur
> radio stations.
>
> The Enforcement Bureau, responding to numerous complaints, had previously
> warned Mr. Flippo to stop his illegal activities and had issued him a
$20,000
> forfeiture. Despite the Enforcement Bureau's administrative response, Mr.
> Flippo did not stop his illegal activity.
>
> The United States Attorney's Office for the Southern District of Florida
> charged Mr. Flippo with four counts of unlicensed radio operation (47
U.S.C. &#65533;
> 301) and four counts of interfering with licensed radio stations (47
U.S.C. &#65533;
> 333), which he allegedly committed between June 8, 1999, and April 11,
2000.
> The United States Marshals Service arrested Mr. Flippo at his Jupiter,
Florida
> home, from which it also seized his radio transmitting equipment.
>
> If convicted, Mr. Flippo could face up to one year in prison and a fine of
up
> to $10,000 for each violation.
>
> Commenting on behalf of the Enforcement Bureau, Jane E. Mago, Deputy
Chief,
> commended the members of the amateur radio community, who provided

information
> leading to Mr. Flippo's arrest, and thanked the United States Attorney's
Office
> for the Southern District of Florida and the United States Marshals
Service for
> their efforts in prosecuting the case.
>
>
> TOP
> FCC INVESTIGATION LEADS TO FINE
> FOR LICENSED AMATEUR RADIO OPERATOR
>
> I. INTRODUCTION
> 1. In this Memorandum Opinion and Order (``Order''), we deny Leonard
Martin's
> petition for reconsideration and affirm the Forfeiture Order1 issued
against
> Leonard D. Martin in the amount of four thousand dollars ($4,000) for
willfully
> and repeatedly violating Sections 301 and 303(n) of the Communications Act
of
> 1934, as amended (``the Act''). 2 The noted violations involve Mr.
Martin's
> operation of a two-way radio station without Commission authorization and
his
> refusal to allow inspections of his radio installation.
>
> 2. On March 3, 2000, the Houston Resident Agent Office (``Houston
Office'')
> issued a Notice of Apparent Liability for Forfeiture (``NAL'') in the
amount of
> seventeen thousand dollars ($17,000) to Mr. Martin for the referenced
> violations.3 Mr. Martin filed a response to the NAL. On July 12, 2000, the
> Enforcement Bureau (``Bureau'') released a Forfeiture Order reducing the
> proposed forfeiture to $4,000.
>
> II. BACKGROUND
> 3. Mr. Martin is the former licensee of amateur station KC5WHN. By letter
of
> November 3, 1998, the Commission notified Mr. Martin of complaints
concerning a
> station identifying as KC5WHN. The complaints asserted that the station
> identifying as KC5WHN was operating on frequencies which were not
authorized
> for that station. In his telephone response to that letter, Mr. Martin
denied
> the alleged unauthorized operation.
>
> 4. On February 27, 1999, an agent from the Houston Office (``the agent''),

> using a mobile automatic direction finding (``MADF'') vehicle, observed
voice
> radio transmissions on frequencies 27.535 and 27.545 MHz. Frequency 27.535
MHz
> is allocated exclusively to Industrial radio stations. Frequency 27.545
MHz is
> allocated exclusively to United States Government radio stations. The
> transmissions were unidentified, but the operator responded to the name
> ``Leonard.'' Using the MADF vehicle, the agent determined that the source
of
> the transmissions was an antenna mounted on the residence at 4415
Spellman,
> Houston, Texas, which was then the address of record for Mr. Martin's
amateur
> service station. There was no record of a Commission authorization
permitting
> Mr. Martin to operate on 27.535 MHz or 27.545 MHz.
>
> 5. On March 15, 1999, the agent, using an MADF vehicle, observed voice
radio
> transmissions on 27.370 MHz, a frequency allocated as a ``guard''
frequency
> between authorized channels in the Citizens Band Radio Service. The
operator
> identified himself as ``Leonard.'' Using the MADF vehicle, the agent
determined
> that the source of the transmissions was a vertical antenna mounted on the
> residence at 4415 Spellman, Houston, Texas. Immediately after his
monitoring
> observations, the agent knocked on the door of the residence. Mr. Martin
> answered the door and refused the agent's request to inspect the radio
station
> located in the residence. The agent informed Mr. Martin that his
previously
> observed operation on 27.535 and 27.545 MHz was unlicensed and in
violation of
> Section 301 of the Act because Mr. Martin held no Commission authorization
to
> operate on those frequencies. The agent also informed Mr. Martin that his
> refusal to allow an inspection constituted violation of Section 303(n) of
the
> Act.
>
> 6. On April 2, 1999, the Houston Office issued Mr. Martin an Official
Notice of
> Violation (``NOV'') for violations of Sections 301 and 303(n) of the Act.
In
> Mr. Martin's April 7, 1999, response to the NOV, he stated: ``I now fully
> understand that operation on the frequencies outlined is a violation ...

that
> the FCC has the authority to inspect all radio installations... [and] ...
I
> promise no further action by the Commission will be necessary to insure my
> complete compliance with the FCC Rules...."
>
> 7. On July 22, 1999, Mr. Martin submitted his amateur service license for
> KC5WHN to the Commission for cancellation. By letter of July 23, 1999, the
> Commission acknowledged receipt of the license, and confirmed that it was
> cancelled effective July 23, 1999. The letter also warned Mr. Martin that
any
> unlicensed radio operation would constitute violation of Section 301 of
the
> Act.
>
> 8. On October 19, 1999, the agent investigated an interference complaint
> against Mr. Martin. The agent, using an MADF vehicle, observed voice radio
> transmissions on frequency 27.535 MHz, and determined that the source of
those
> transmissions was a vertical antenna mounted on Mr. Martin's residence, at
4415
> Spellman, Houston, Texas. This frequency is allocated exclusively to licen
sed
> Industrial radio stations. There was no record of a Commission
authorization
> permitting Mr. Martin to operate on 27.535 MHz.
>
> 9. On October 26, 1999, the agent, using an MADF vehicle, observed voice
radio
> transmissions on 27.455 MHz, a frequency allocated exclusively to
Industrial
> radio stations. Using the MADF vehicle, the agent determined that the
source of
> those transmissions was a vertical antenna mounted on Mr. Martin's
residence,
> at 4415 Spellman, Houston, Texas. There was no record of a Commission
> authorization permitting Mr. Martin to operate on 27.455 MHz. Immediately
after
> the monitoring, the agent knocked on the door of the residence and
requested
> permission to inspect the station located there. Mr. Martin, who answered
the
> door, refused to allow an inspection.
>
> 10. On March 3, 2000, the Houston Office issued a NAL in the amount of
$17,000
> to Mr. Martin for violations of Sections 301 and 303(n) of the Act. In his
> response to the NAL, Mr. Martin requested cancellation of the proposed
> forfeiture but did not deny violating Sections 301 and 303(n).

>
> 11. In its Forfeiture Order, released July 12, 2000, the Bureau concluded
that
> Mr. Martin willfully and repeatedly violated Section 301 of the Act by
> operating radio transmitting apparatus without authorization on February
27,
> October 19, and October 26, 1999; and that he willfully and repeatedly
violated
> Section 303(n) of the Act by refusing to make his radio installation
available
> for inspection on March 15 and October 26, 1999. The Forfeiture Order
assessed
> a monetary forfeiture of $4,000 for those violations. The sole basis for
> reducing the $17,000 forfeiture amount proposed by the NAL to $4,000 was
Mr.
> Martin's inability to pay more than $4,000.
>
> 12. In his petition for reconsideration of the Forfeiture Order, Mr.
Martin
> still does not deny operating radio transmitting apparatus without
> authorization or refusing to make his radio installation available for
> inspection. However, he propounds the following arguments for reduction or
> rescission of the forfeiture:
>
> (a) The Commission ``failed to comply with its own procedures.''
Specifically,
> Mr. Martin asserts that, when an FCC agent requested permission to inspect
his
> radio installation, the agent ``did not provide [Mr. Martin] proper notice
to
> inspect [Mr. Martin's] communications devices or of any pending
investigation,
> or allow [Mr. Martin] an opportunity to have an attorney present'' and did
not
> allow sufficient time for Mr. Martin ``to exercise [his] rights as a U.S.
> Citizen to review any FCC rule or federal law that would permit
unwarranted
> entry into [his] residence by the FCC.''
>
> (b) The Forfeiture Order ``is based upon unsubstantiated allegations with
> insufficient evidentiary support.'' In particular, Mr. Martin contends
that
> another station near his residence ``could have been'' the source of the
> transmissions observed by the FCC agent and that there is insufficient
proof
> that Mr. Martin was the operator the station observed by the FCC agent.
>
> (c) The forfeiture amount is ``grossly disproportionate to the alleged
> violations.'' Specifically, Mr. Martin asserts that the forfeiture amount

of
> $4,000 is unreasonable ``given the nature and extent of the alleged
> violations.'' Mr. Martin also contends that the Bureau did not consider
all the
> required mitigating factors. According to Mr. Martin, these include: the
number
> of occurrences; the corrective measures Mr. Martin agreed to take; Mr.
Martin's
> ability to pay; and ``the fact that no licensed radio station complained
of
> interference nor was there any proof of actual harm caused by any radio
> transmission from [Mr. Martin's] residence.''
>
> (d) The Commission, by imposing a forfeiture against Mr. Martin, has
exceeded
> its authority to regulate interstate communications under the Commerce
Clause
> of the Constitution. Mr. Martin argues that, although Section radio
> communications within one state as well as between states, the statute
must be
> interpreted and applied in a manner consistent with constitutional
limitations.
> In particular Mr. Martin claims that, because there has been no showing
that
> his transmissions were capable of causing harmful interference to
interstate
> communications, he cannot be prohibited from making those transmissions
without
> a license.
>
> (e) The prohibition of transmissions by Mr. Martin on frequencies for
which he
> is not authorized and the imposition of a monetary forfeiture against Mr.
> Martin for making such transmissions violate the First Amendment to the
United
> States Constitution.
>
> (f) The imposition of a forfeiture against Mr. Martin without an
opportunity
> for a hearing or ``to remedy [Mr. Martin's] alleged violation Section 301
of
> the Communications Act'' violates the Due Process clause of the Fourteenth
> Amendment to the United States Constitution.
>
> (g) The Commission is violating the Due Process clause of the Fourteenth
> Amendment to the United States Constitution by ``selectively'' initiating
a
> forfeiture proceeding against Mr. Martin and ``not targeting thousands of
other

> stations" which operate without authorization.
>
>
> III. DISCUSSION
> 13. We reject the arguments made in Mr. Martin's petition for
reconsideration:
>
> (a) The agent who requested permission to inspect Mr. Martin's radio
> installation on March 15 and October 26, 1999, followed proper procedures.
On
> both occasions the agent informed Mr. Martin that Section 303(n) of the
Act
> authorizes the Commission to inspect radio installations and that the
agent had
> traced transmissions on frequencies for which Mr. Martin was not
authorized to
> Mr. Martin's residence. Immediate, on-the-spot inspections are necessary
in
> such circumstances because ``Any delay . . . can result in changed
conditions
> of the transmitting equipment or its operation, adversely affecting the
> efficiency of inspections." Ralph Yago, 35 FCC 113, 125 (Rev.Bd. 1963).
> Further, nothing in the Communications Act requires the Commission to
allow a
> subject of an inspection to have opportunity to have an attorney present
during
> a civil investigation proceeding.
>
> (b) The Bureau's conclusion that Mr. Martin operated radio transmitting
> apparatus without authorization on February 27, October 19, and October
26,
> 1999, is supported by substantial evidence. On each occasion, the agent
> determined electronically that transmissions on a frequency or frequencies
for
> which Mr. Martin was not authorized emanated from an antenna installed at
Mr.
> Martin's residence. The only person observed at Mr. Martin's residence on
any
> of these occasions was Mr. Martin. Mr. Martin has had ample opportunity to
> provide information, if it exists, which shows that another person
operated the
> station located at his residence; but he has not done so. During the
> transmissions observed on February 27, 1999, the operator of the station
> located at Mr. Martin's residence responded to the name ``Leonard."
>
> (c) As the NAL explicitly states, the forfeiture amount in this case was
> assessed in accordance with Section 503(b) of the Act,4 Section 1.80 of
the
> Rules,5 and The Commission's Forfeiture Policy Statement and Amendment of

> Section 1.80 of the Rules to Incorporate the Forfeiture Guidelines, 12 FCC Rcd
> 17087 (1997), recon. denied, 15 FCC Rcd 303 (1999) (``Policy Statement'').
> Section 503(b) of the Act requires that, in examining Mr. Martin's response,
> the Commission take into account the nature, circumstances, extent and gravity
> of the violation and, with respect to the violator, the degree of culpability,
> any history of prior offenses, ability to pay, and other such matters as
> justice may require.6 In the Forfeiture Order, we considered all factors
> applicable to this matter and reduced the monetary forfeiture from $17,000 to
> $4,000 on the basis of Mr. Martin's inability to pay a larger amount. Mr.
> Martin has not furnished any information which justifies a further reduction.
>
> (d) Mr. Martin's Commerce Clause argument is dependent on the incorrect
> assumption that transmissions emanating from his residence on 27.445, 27.535
> and 27.545 MHz are not capable of interfering with interstate communications.
> In fact, transmissions on those frequencies are capable of long range
> (interstate) propagation through the natural phenomenon known as sky (``skip'')
> wave. Furthermore, the view that the Commission cannot constitutionally
> regulate communications unless they are capable of interfering with interstate
> communications is erroneous. See National Broadcasting Co. v. United States,
> 319 U.S. 190, 209-217 (1943); FCC v. League of Women Voters of California, 468
> U.S. 364, 377 (1984); and Stephen Paul Dunifer, 11 FCC Rcd 718, 727 (1995).
>
> (e) The prohibition against unlicensed operation does not abridge Mr. Martin's
> First Amendment rights. The United States Supreme Court has held repeatedly
> that there is no constitutional right to use radio facilities without a
> license. See Red Lion Broadcasting Co. v. FCC, 395 U.S. 367, 388 (1969); and
> National Broadcasting Co. v. United States, 319 U.S. 190, 227 (1943).
>
> (f) . The Commission did not abridge Mr. Martin's right to procedural Due
> Process by failing to provide opportunities for an evidentiary hearing and for
> correction of the violations prior to the imposition of the forfeiture.
> Sections 503 and 504 of the Communications Act7 provide safeguards which

> satisfy Due Process requirements.8 See Stephen Paul Dunifer, 11 FCC Rcd 718,
> 729 (1995). Further, nothing in the Communications Act requires the Commission
> to provide an unlicensed operator the opportunity for an evidentiary hearing or
> an opportunity to correct a violation prior to imposition of a forfeiture.
>
> (g) The Commission did not abridge Mr. Martin's right to procedural Due Process
> by proceeding against him ``selectively.'' The case against Mr. Martin arose
> from the routine investigation of a complaint. As the Commission stated in
> KMAP, Inc., 46 FCC 2d 978 (1974): ``While our limited resources may result in
> some violators going unpunished, that does not mean that we cannot impose
> sanctions against those violators we do find.''9
>
> 14. We have examined Mr. Martin's petition for reconsideration pursuant to the
> statutory factors set forth above, and in conjunction with the Policy Statement
> as well. As a result of our reconsideration, we conclude that Mr. Martin has
> failed to provide a sufficient justification for rescission or further
> reduction of the forfeiture.
>
> IV. ORDERING CLAUSES
> 15. ACCORDINGLY, IT IS ORDERED that, pursuant to Section 1.106 of the Rules,
> Mr. Martin's petition for reconsideration IS DENIED and the Forfeiture Order,
> 15 FCC Rcd 12699 (Enf. Bur. 2000), released on July 12, 2000, IS AFFIRMED.
>
> 16. Payment of the forfeiture of $4,000 shall be made in the manner provided
> for in Section 1.80 of the Rules within 30 days of the release of this Order.
> If the forfeiture is not paid within the period specified, the case may be
> referred to the Department of Justice for collection pursuant to Section 504(a)
> of the Act.10 Payment may be made by mailing a check or similar instrument,
> payable to the order of the ``Federal Communications Commission,'' to the
> Federal Communications Commission, P.O. Box 73482, Chicago, Illinois
> 60673-7482. The payment should note ``NAL/Acct. No. X3254-003'' referenced
> above. Requests for full payment under an installment plan should be sent to:
> Chief, Credit and Debt Management Center, 445 12th Street, S.W.,

Washington,
> D.C. 20554.11
>
> 17. IT IS FURTHER ORDERED that a copy of this Order shall be sent by
Certified
> Mail -- Return Receipt Requested, to Mr. Leonard D. Martin at 4415
Spellman,
> Houston, Texas 77035.

> Amateur radio operator Robert L. Meyers N5WLY
> loses license and pays ($1000) fine
>
> ORDER
>
>
> Adopted: October 5, 2000 Released: October 10, 2000
>
> By the Chief, Enforcement Bureau:
>
> 1. In this Order, we adopt a Consent Decree terminating a forfeiture
proceeding
> against Robert L. Meyers (``Meyers'') concerning operation of an Amateur
Radio
> transmitter in violation of Section 333 of the Communications Act of 1934,
as
> amended (the ``Act''), and Sections 97.101(d) and 97.119(a) of the
Commission's
> Rules (the ``Rules'').1 Meyers agrees to submit his Amateur Radio license
for
> cancellation and not re-apply for an Amateur license for a period of 5
years.
> Meyers further agrees to make a voluntary contribution to the U.S.
Treasury of

> $1,000.
>
> 2. The Enforcement Bureau assessed an $8,000 forfeiture against Meyers for
> violation of Section 333 of the Act and Sections 97.101(d) and 97.119(a)
of the
> Rules.2
>
> 3. The Enforcement Bureau staff and Meyers have negotiated the terms of a
> Consent Decree that would terminate this proceeding. A copy of the Consent
> Decree is attached hereto and incorporated by reference.
>
> 4. We have reviewed the terms of the Consent Decree and evaluated the
facts
> before us. We believe that the public interest would be served by
approving the
> Consent Decree and terminating this proceeding.
>
> 5. Accordingly, IT IS ORDERED, pursuant to Sections 4(i) and 4(j) of the
> Communications Act of 1934, as amended, 47 U.S.C ¬¬ 154(i) and 154(j), and
the
> authority delegated in Sections 0.111 and 0.311 of the Commission's Rules,
47
> C.F.R. ¬¬ 0.111 and 0.311, that the attached Consent Decree is hereby
ADOPTED.
>
> 6. IT IS FURTHER ORDERED that the voluntary contribution referenced in the
> Consent Decree shall be paid by a check or money order drawn to the order
of
> the ``Federal Communications Commission.'' Reference should be made on the
> check or money order to ``NAL Acct. No. X3254- 001.'' The remittance
should be
> sent to: Forfeiture Collection Section, Finance Branch, Federal
Communications
> Commission, P.O. Box 73482, Chicago, Illinois 60673-7482.
>
> 7. IT IS FURTHER ORDERED that the above captioned forfeiture proceeding IS
> TERMINATED.

>
> FORFEITURE ORDER
>
>
> Adopted: May 2, 2000 Released: May 3, 2000
>
> By the Chief, Enforcement Bureau:
>

>
> I. INTRODUCTION
> 1. In this Forfeiture Order (``Order''), we issue a monetary forfeiture in
the
> amount of eight thousand dollars ($8,000) against Paul E. Holcombe,
licensee of
> amateur radio station K4TOF, Houston, Texas, for willful violation of
Section
> 333 Communications Act of 1934, as amended (``the Act''),1 and Sections
> 97.101(d) and 97.119 of the Commission's Rules.2 The noted violations
involve
> the operation of an amateur radio station so as to willfully or
maliciously
> cause interference to radio communications and the transmission of
unidentified
> amateur radio communications.
>
> 2. On January 13, 2000, the Commission's Resident Agent Office in Houston,
> Texas, issued a Notice of Apparent thousand dollars ($8,000) to Mr.
Holcombe.3
> Mr. Holcombe filed a response on February 4, 2000.
>
>
> II. BACKGROUND
> 3. Between 1993 and 1999, the Commission's Houston Resident Agent Office
> received numerous complaints alleging intentional interference to users on
the
> Memorial Emergency Repeater Association's 145.470/144.870 MHz amateur
radio
> repeater in Houston (``MERA repeater''). The interference was allegedly
caused
> by stations transmitting unidentified tones, inflammatory or derogatory
> remarks, and unmodulated signals, none of which were identified with an
> FCC-assigned call sign.
>
> 4. On May 25, 1999, an FCC agent from the Houston Office, using a mobile
> automatic direction finding (``MADF'') vehicle to monitor the MERA
repeater,
> observed a radio signal consisting of unidentified tones and remarks being
> transmitted on the input frequency of the MERA repeater. The agent
> simultaneously monitored the output frequency of the MERA repeater and
observed
> that this signal would transmit immediately after other stations began
> transmitting, resulting in interference to communications already in
progress
> on the MERA repeater. At about 8:08 p.m., using the MADF equipment and
> direction-finding techniques, the agent determined that the source of the
> unidentified interfering transmissions was a silver Toyota bearing Texas
> license plate DVZ74F. This vehicle was registered to Paul E. Holcombe,

licensee
> of amateur radio station K4TOF. Immediately thereafter, the Commission
agent
> conducted an interview with Mr. Holcombe and inspected the vehicle. Inside
the
> vehicle, the agent found an amateur radio transceiver which was tuned to
the
> MERA repeater frequency pair and was capable of transmitting on the MERA
> repeater frequency pair. Although Mr. Holcombe admitted that he owned the
> vehicle and the amateur radio transceiver and that he was the licensee of
> amateur radio station K4TOF, he denied intentionally making any radio
> transmissions that day.
>
> 5. On June 2, 1999, the Houston Office issued to Mr. Holcombe an Official
> Notice of Violation (``NOV'') for willful and malicious interference to
radio
> communications in violation of Section 333 of the Act and Section
97.101(c)4 of
> the Rules and for transmitting unidentified amateur radio communications
in
> violation of Section 97.119 of the Rules. In his June 4, 1999, response to
the
> NOV, Mr. Holcombe stated that his amateur radio station may have been
> inadvertently activated on May 25, 1999, but he denied any intent to
interfere
> with other stations. Mr. Holcombe also stated that he suffered from a
nerve
> disorder in his hands which makes it difficult for him to manipulate the
> controls of the amateur radio transceiver in his vehicle.
>
> 6. On January 13, 2000, the Houston Office issued the subject NAL, citing
Mr.
> Holcombe for willful violations of Section 333 of the Act and Sections
> 97.101(d) and 97.119 of the Rules. In his February 4, 2000, response to
the
> NAL, Mr. Holcombe denies that the violations occurred. Mr. Holcombe
asserts
> that there was a passenger in his car on May 25, 1999, Dennis Rogers, who
is
> willing to testify that the alleged violations did not occur. Mr. Holcombe
> states that Mr. Rogers told the FCC agent at the time that the alleged
> violations did not take place, but the agent discounted his statement. In
> addition, Mr. Holcombe asserts that the NAL unfairly holds him responsible
for
> violations dating back to 1993. Mr. Holcombe maintains that he is being
charged

>Sparky wrote :
>:How is your PIN going to maintain Vf for the full RF cycle?

Not really. I think anyone familiar with PIN diodes understands that all you need to do is shove the signal's DC component up or down a volt or so. That works fine for smaller signals and low power, but the suggestion was 2.5kW. A few more things need to be considered, like the capacitive reactance of the diodes: will it cause enough of a voltage drop or phase shift to either overload or shut off the diode? Is a PIN (or any semiconductor) that is capable of switching such a high power level also capable of permitting a microvolt-level signal to pass without adding significant noise? What is the insertion loss for such a large device? Where does the 2.5kW go when the diode fails? How about fault detection? Despite the receiver being grounded, how much isolation can they provide at 2.5kW?

These questions are all part of the design criteria. I have used PINs in the past, but never in any high-power application such as this. I don't even want to -imagine- doing a failure analysis on such a radio.

I may be old-fashioned here, but I tend to prefer the use of properly timed and sequenced relays for anything more than a hundred watts or so. They are more reliable, easier to replace, and give that nice "clack" sound that tells you everything is working just fine. And with a proper circuit, relay failure will damage nothing else. You might like PIN diodes and that's fine, but for ease of design, construction, and reliability, it's hard to beat a good, solid relay.

Thats why there is C.B. (MY Interpretation is Chicken Band for all those to chicken to try and pass a simple tell that shows they might have a clue as to what they are doing) Breaker 61 break break
"For Example John Smith" <lerb@dejazzd.com> wrote in message news:Pim38.19947$F01.1166884@nnrp1.ptd.net...
Actually you point in case of an global emergency is quite lame.....take the global comunications structure you now have away from you and you would BEG a ham to make an autopath for you. For the ignorant and stupid of you out there believe or not right now there arm MANY vollunteer hams that are right now autopatching back to the US during our war times. Yes hams actually sit all day long and make necessary phone calls for our government back to the good ol USA. Now for you dumb people out there exsplain to me why they do this??? Simple its the best way to communicate.
"Karl Vesterling" <karl.vesterling@verizon.net> wrote in message news:%Za38.7731$hp6.4430@nwrddc01.gnilink.net...
Getting rid of the Morse requirement for the HF bands. I second that motion!

Here's why. Years ago people used to beat very loud drums to communicate over very long distances. Some even used smoke signals. I cannot I imagine a situation where I would have to use either one of those methods to communicate. Nor can I see any use for Morse Code with today's available technology.

Having Morse Code as a requirement for HF privleges is analogous to requiring the knowledge of how to saddle a horse in order to get your drivers license. As far as you CDL endorsed guys out there, you'd have to learn how to hitch a wagon.

I mean, what's next? Having to make a telephone out of two tin cans and a string in order to get a computer networking degree from Duh-Vry?

It serves no purpose at all. Why bother knowing how to transmit 13 wpm when you can send data at WAAY faster speeds halfway across the planet in under 300ms?????

No - wait. Let me think about this. Here are the only possible scenarios I can imagine that justify Morse Code as a requirement for HF use.

1.. If the commies attacked and most of our transistors were blown from the EMP then the old tube rig would be the only thing that would function as I'm hiding under my 1950's desk / emergency bomb shelter.

2.. What if the earth crashes into the sun? The solar flares would knock out all of our communications satellites for sure then! Tubes would be the only option!

3.. Suppose those Aliens that call into Art Bell from the future decide to attack earth with their super magneto ditigilator distructor beam weapon?

I'm running short here on Ideas for "HYPOTETICAL" situations where I would actually need to know Morse Code, smoke signals, or pound on some very loud drums in today's world. Feel free to contribute to the list!

Dunno... Nostalgia? That seems to be the only purpose for it.
